

# Xilinx Zynq-7000 & Vitis software Introduction

# Agenda

## ➤ Zynq-7000 Introduction

- Zynq-7000 Architecture
- Processing System (PS) Components
- Advanced eXtensible Interface (AXI) Bus
- PS-PL Interfaces
- PS Clocking Sources
- Resets
- Zynq Boot and Configuration

## ➤ Vitis Development Workflow

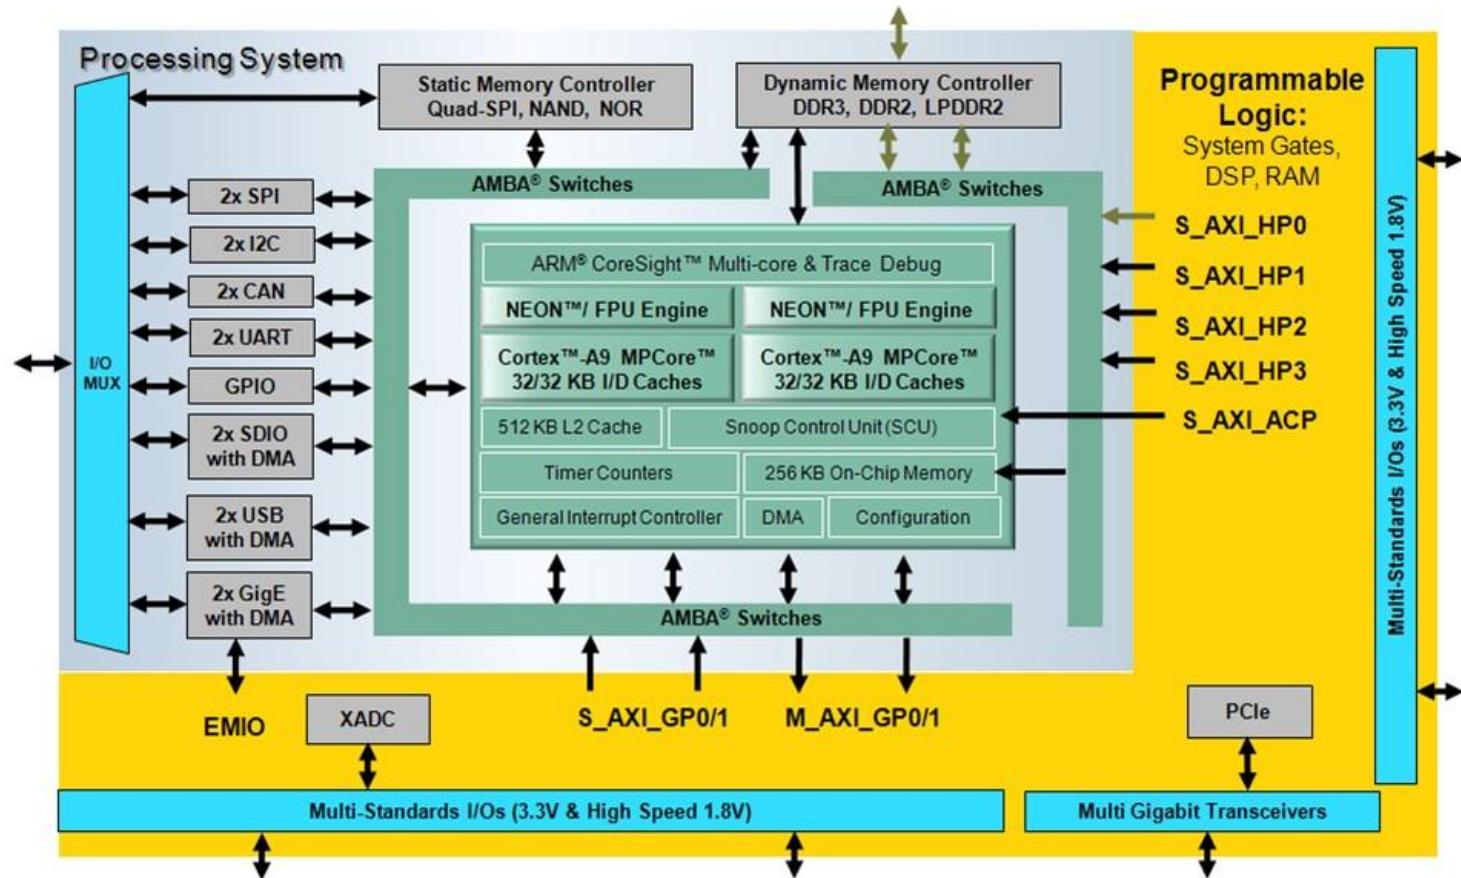

- Vitis Introduction
- Preparatory Work from Vivado
- Vitis Project Build

# Zynq-7000 Introduction

# Zynq-7000 Architecture Overview

- Complete ARM®-based processing system
  - Application Processor Unit (APU)
    - ARM Cortex™-A9 processor
    - Caches and support blocks
  - Fully integrated memory controllers
  - I/O peripherals
- Tightly integrated programmable logic
  - Used to extend the processing system
  - Scalable density and performance
- Flexible array of I/O
  - Wide range of external multi-standard I/O
  - High-performance integrated serial transceivers
  - Analog-to-digital converter inputs

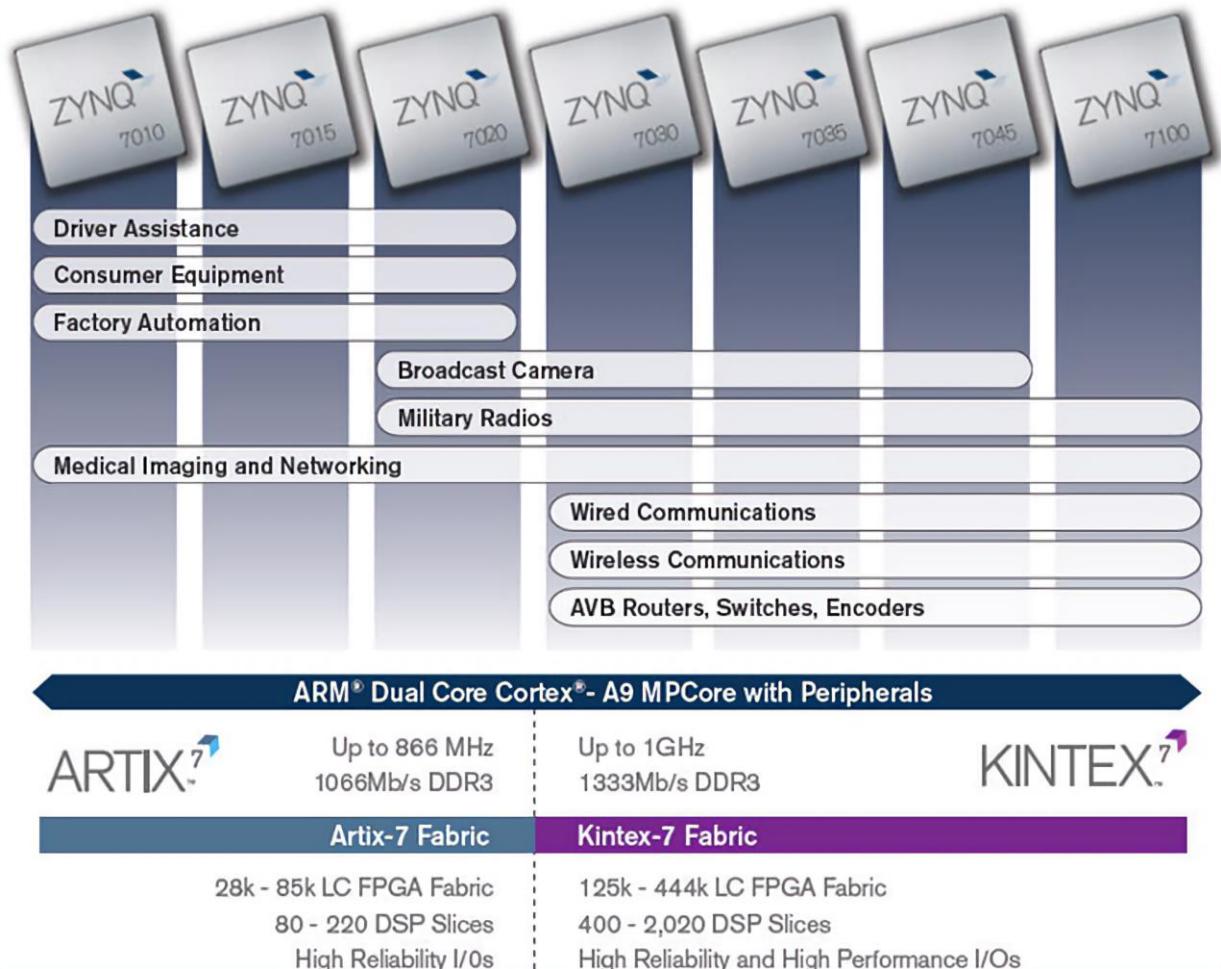

# Zynq-7000 Architecture Overview

- Zynq-7000 Family

Processing System (PS)	Cost-Optimized Devices						Mid-Range Devices										
	Device Name	Z-7007S	Z-7012S	Z-7014S	Z-7010	Z-7015	Z-7020	Z-7030	Z-7035	Z-7045	Z-7100

# Zynq-7000 Architecture Overview

- The Zynq-7000 AP SoC architecture consists of two major sections
  - PS: Processing system
    - ARM Cortex-A9 processor based
    - Multiple peripherals
    - Hard silicon core
  - PL: Programmable logic
    - Uses the same 7 series programmable logic
      - Artix™-based devices: Z-7010, Z-7015 and Z-7020  
(high-range I/O banks only)
      - Kintex™-based devices: Z-7030, Z-7035, Z-7045, and Z-7100  
(mix of high-range and high-performance I/O banks)

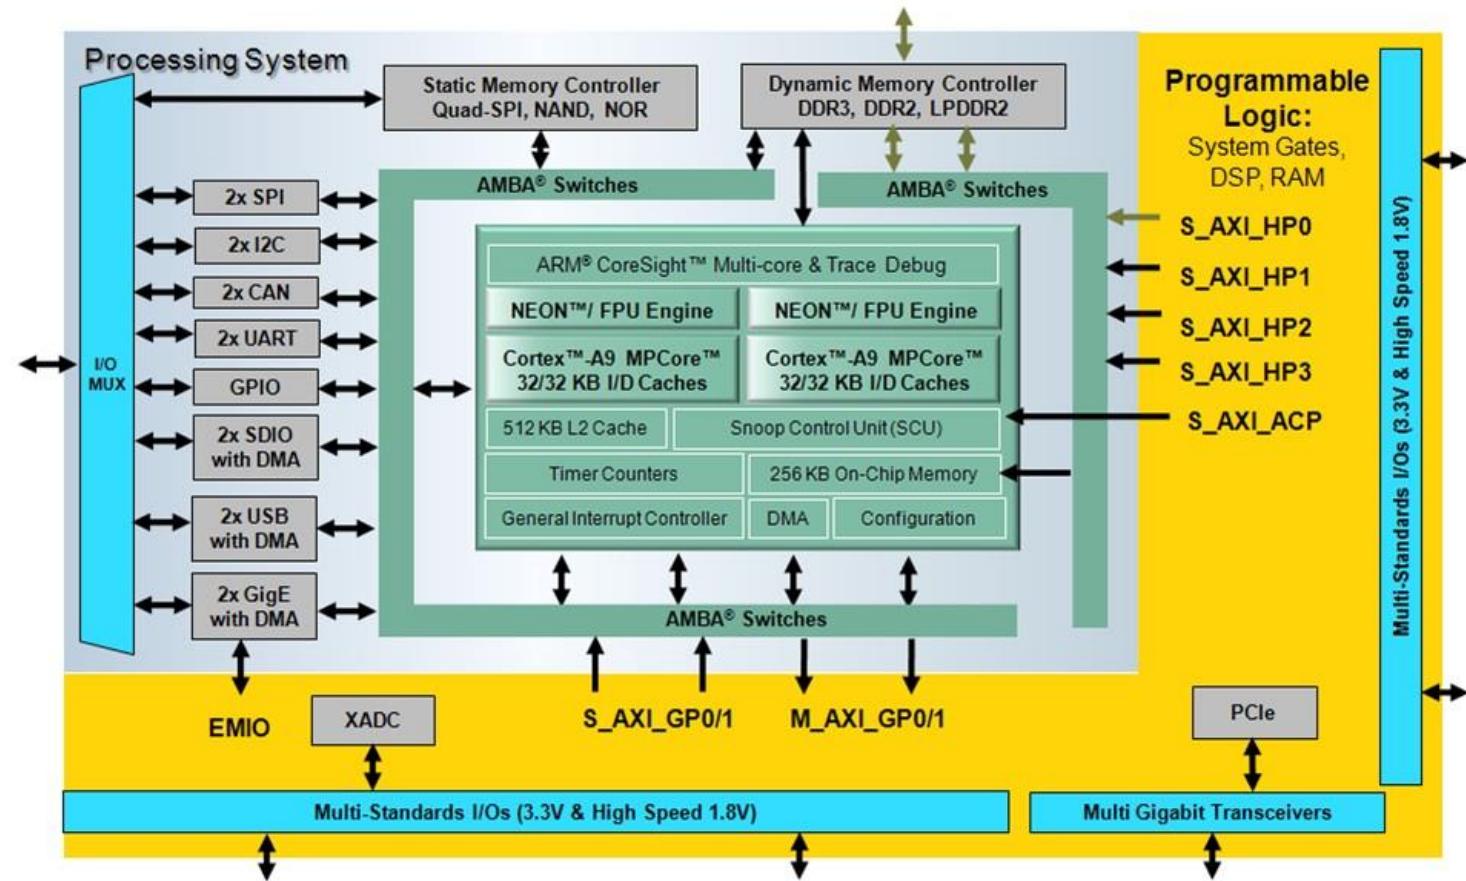

# ARM Processor Product Families

- Legacy ARM processors
  - ARM7, ARM9 (not the Cortex-A9 processor), ARM11
- Cortex family of processors
  - **Cortex-A#:** "A" application
    - The products support a memory management unit (MMU)
    - Excellent for operating systems
  - **Cortex-R#:** "R" real time
    - The products support a memory protection Unit (MPU)
    - Better determinism than an MMU
  - **Cortex-M#:** "M" Embedded microcontroller

# Zynq-7000 Architecture Overview

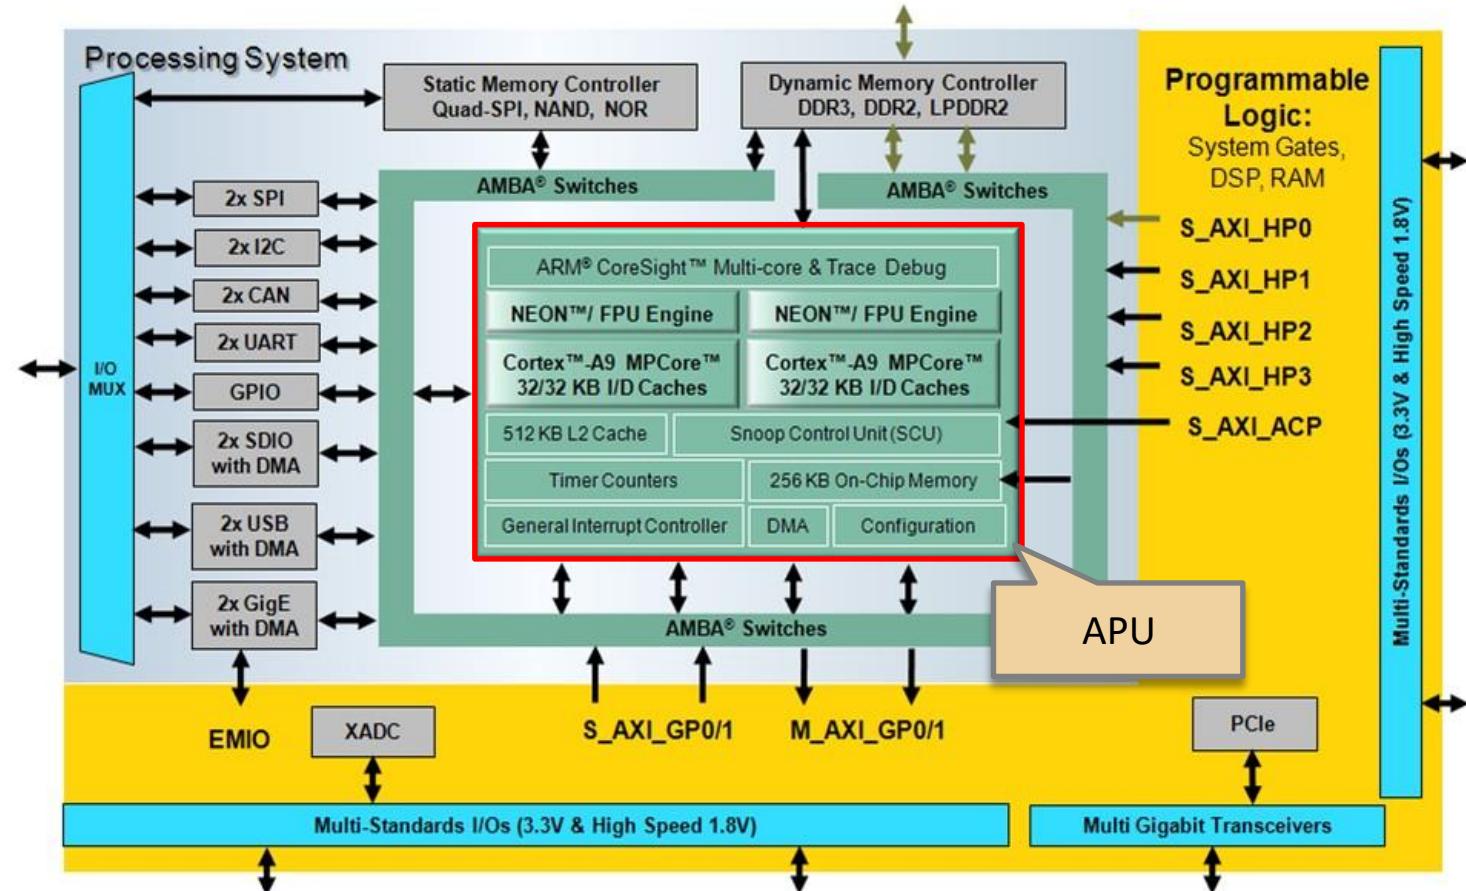

- Processing System (PS) Components

- Application processor unit (APU)
- Memory interfaces
- I/O peripherals (IOP)
- Interconnect

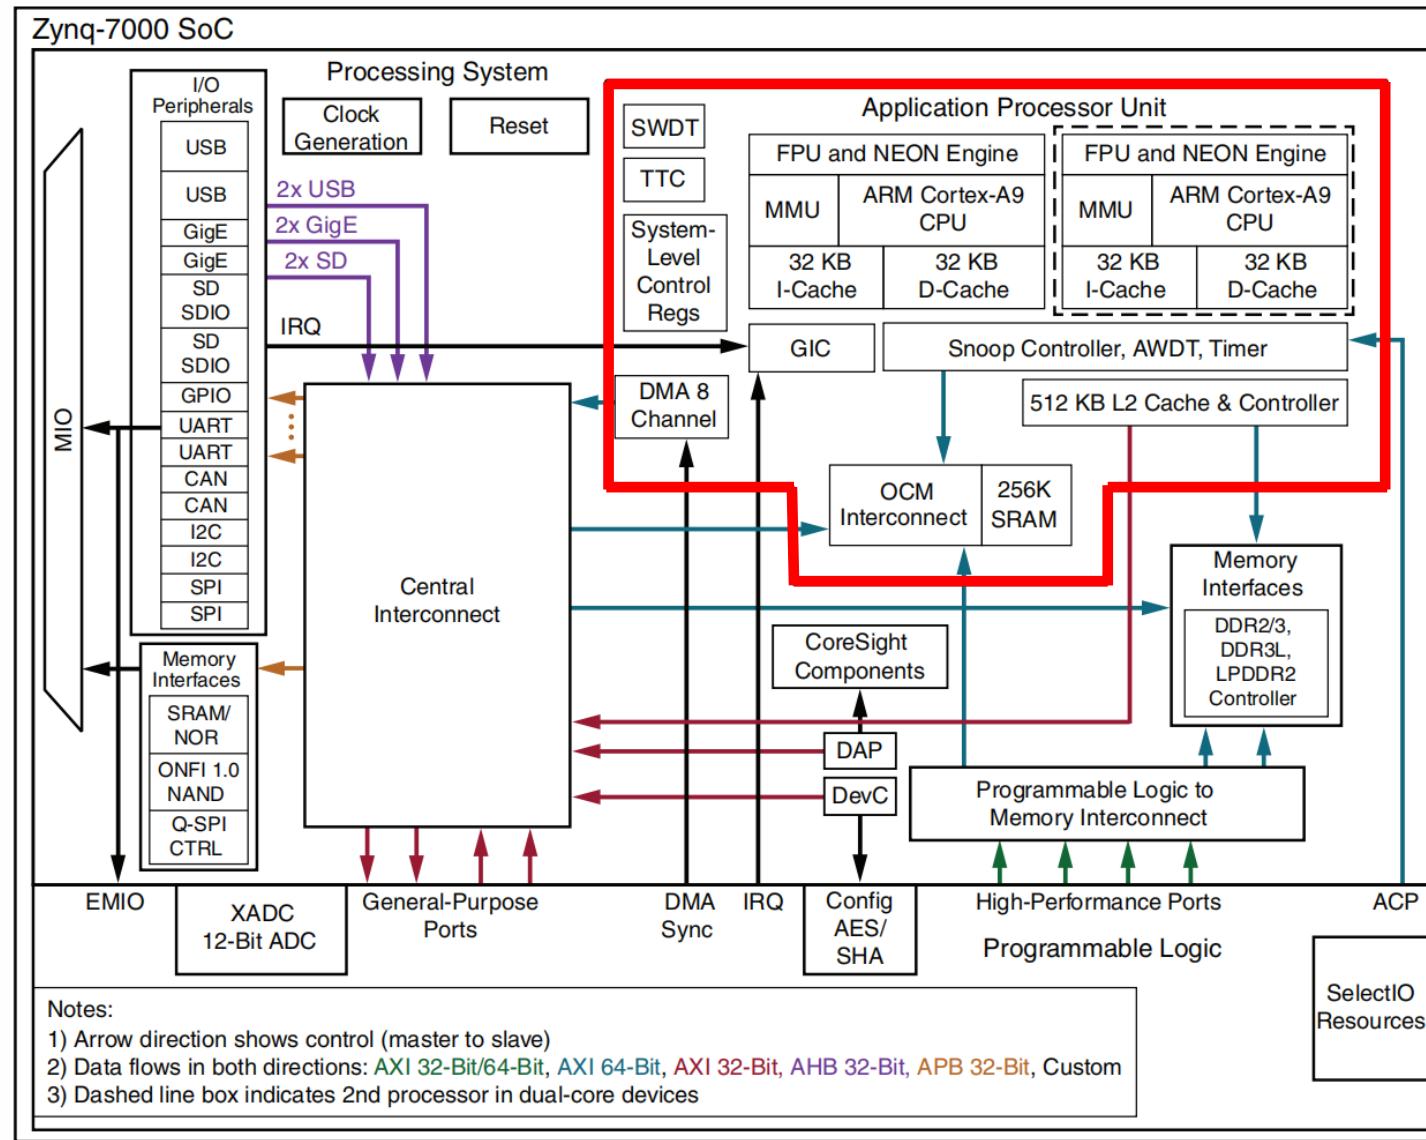

# Processing System (PS) Components

- Application processor unit (APU)
- Memory interfaces
- I/O peripherals (IOP)
- Interconnect

# Processing System (PS) Components

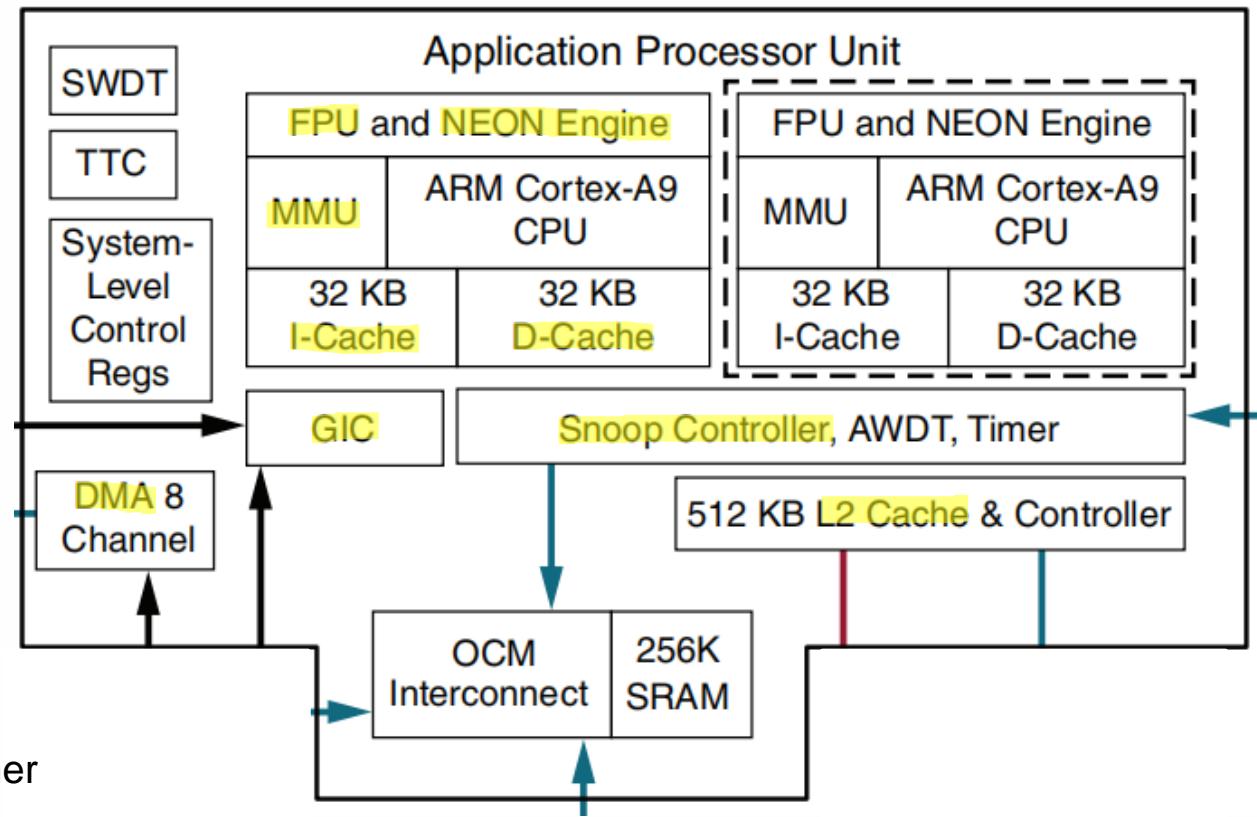

- Application Processing Unit (APU)

# Processing System (PS) Components

- Application Processing Unit (APU)

- Single/Dual A9 core
  - FPU and NEON Engine (Float Point Unit & NEON)
  - MMU (Memory Management Unit)
  - A9 CPU (central processing unit)
  - 32KB I-Cache (Instruction Cache)
  - 32KB D-Cache (Data Cache)
- SWDT (System Watch Dog Timer)
- TTC (Triple Timer/Counter)
- System-Level Control Regs
- DMA 8 Channel (Direct Memory Access)
- GIC (General interrupt controller)
- Snoop Controller, AWDT (ARM Watch Dog Timer), Timer
- 512KB L2 Cache & Controller
- OCM Interconnect 256K SRAM (On-Chip Memory)

# Processing System (PS) Components

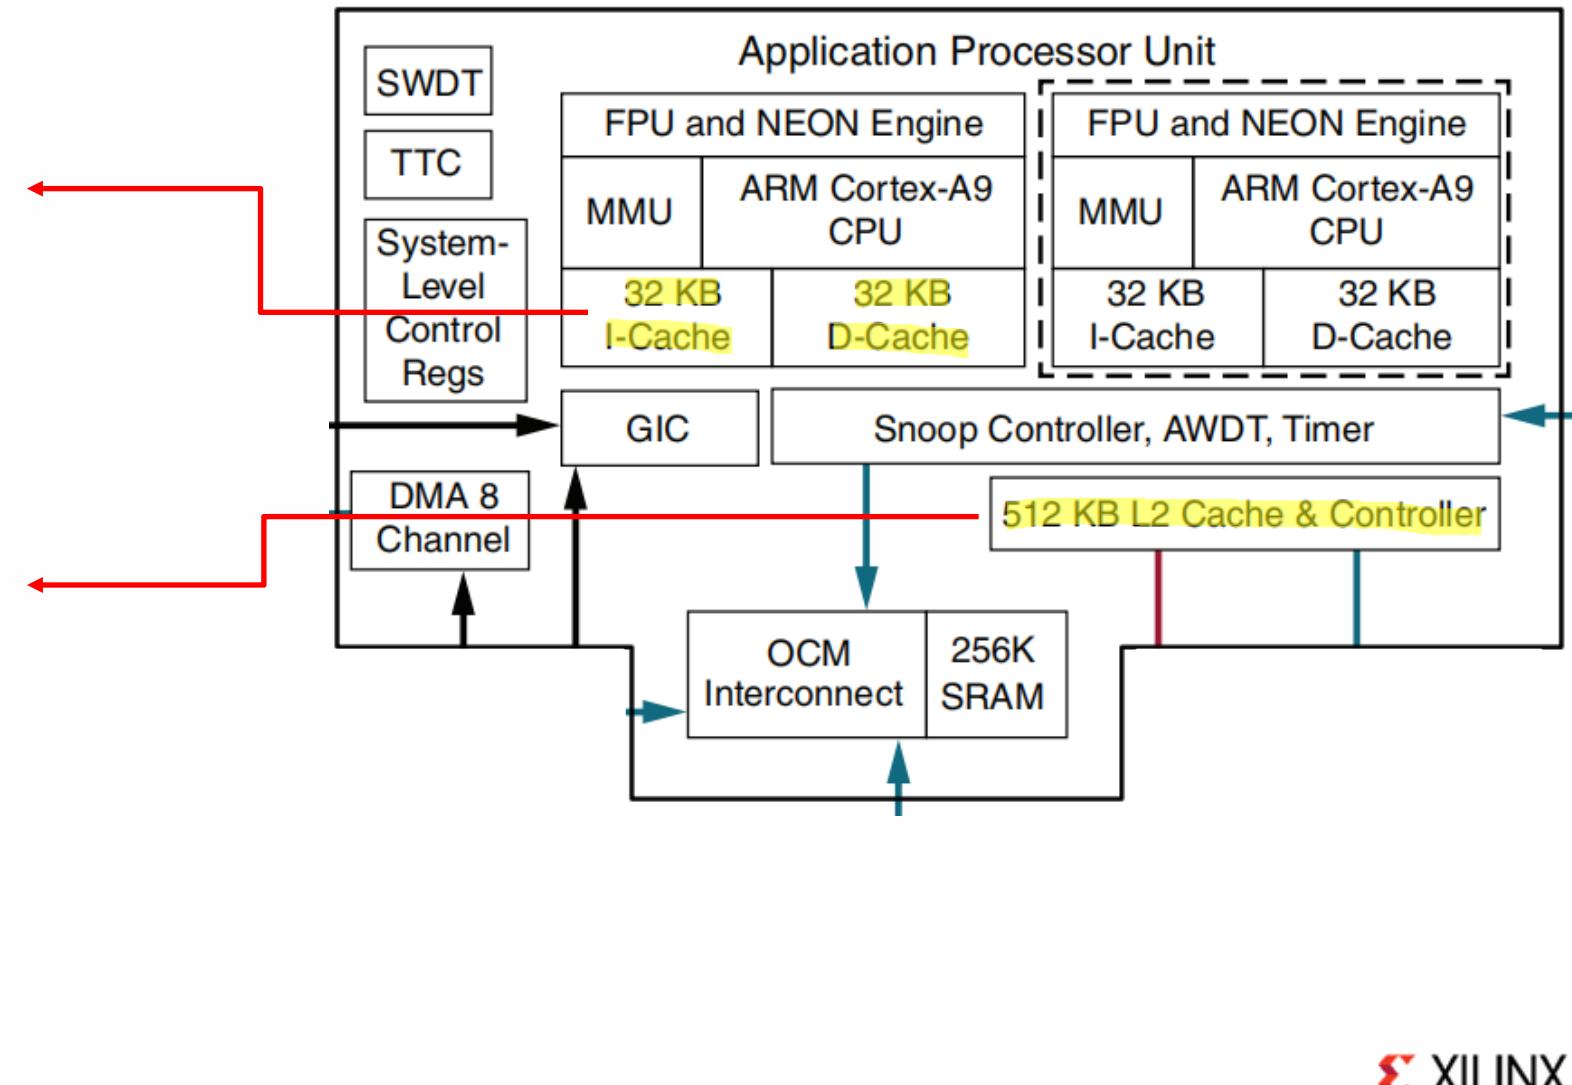

- Application Processing Unit (APU)

## L1 cache

- Smallest size but fastest access
- 32 KB each for instruction and data
- One I-cache and D-cache per CPU

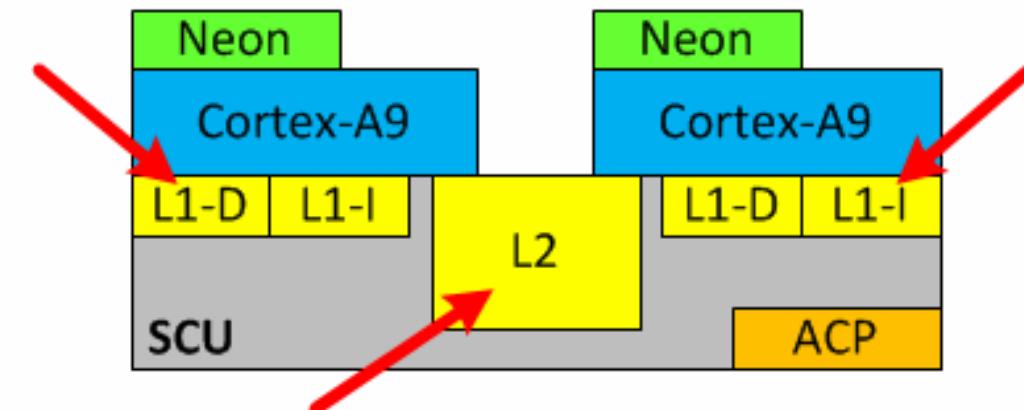

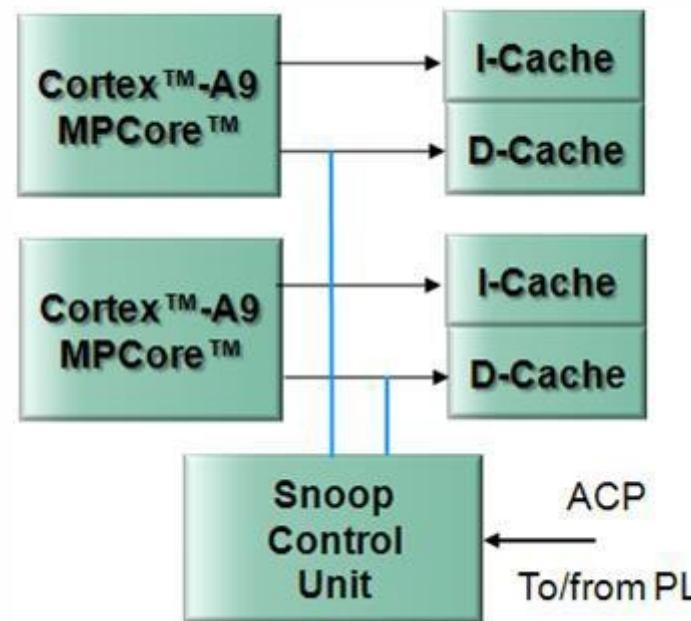

## L2 cache

- Secondary, larger cache
- 512 KB
- Used for both instruction and data
- One per snoop control unit (SCU)

# Snoop Control Unit (SCU)

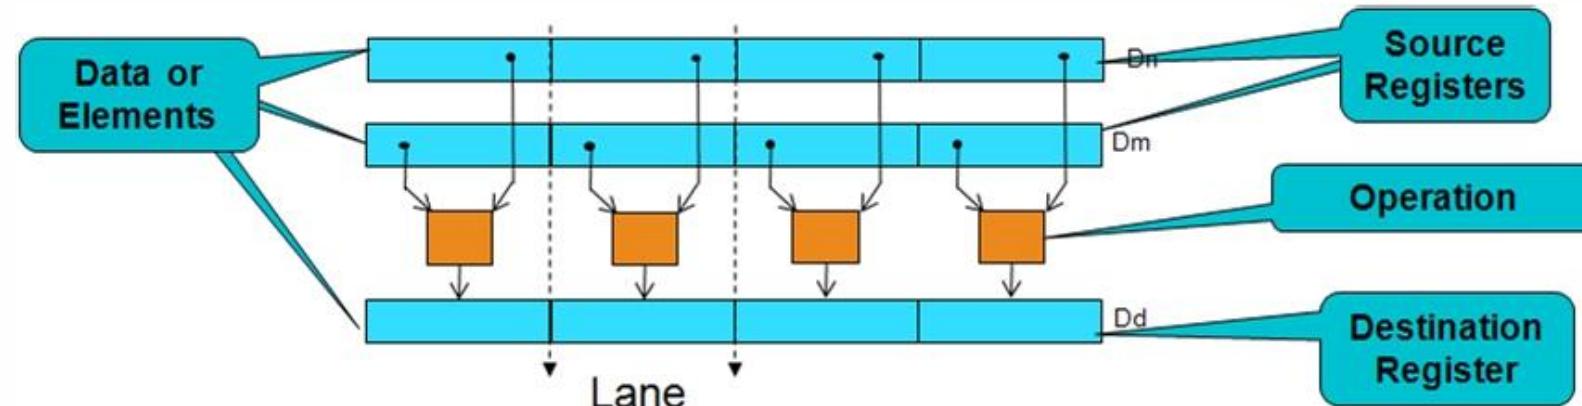

- Shares and arbitrates functions between the two processor cores
  - Data cache coherency between the processors
  - Initiates L2 AXI memory access
  - Arbitrates between the processors requesting L2 accesses
  - Manages ACP accesses
  - A second master port with programmable address filtering between OCM and L2 memory support

# NEON Instruction

- Vector Processing using NEON
- NEON is the ARM codename for the vector processing unit
  - Provides multimedia and signal processing support
- FPU is the floating-point unit extension to NEON
  - Both NEON and FPU share a single set of registers
- NEON technology is a wide single instruction, multiple data (SIMD) parallel and co-processing architecture
  - 32 registers, 64-bits wide (dual view as 16 registers, 128-bits wide)
  - Data types can be signed/unsigned 8-bit, 16-bit, 32-bit, 64-bit, or 32-bit float

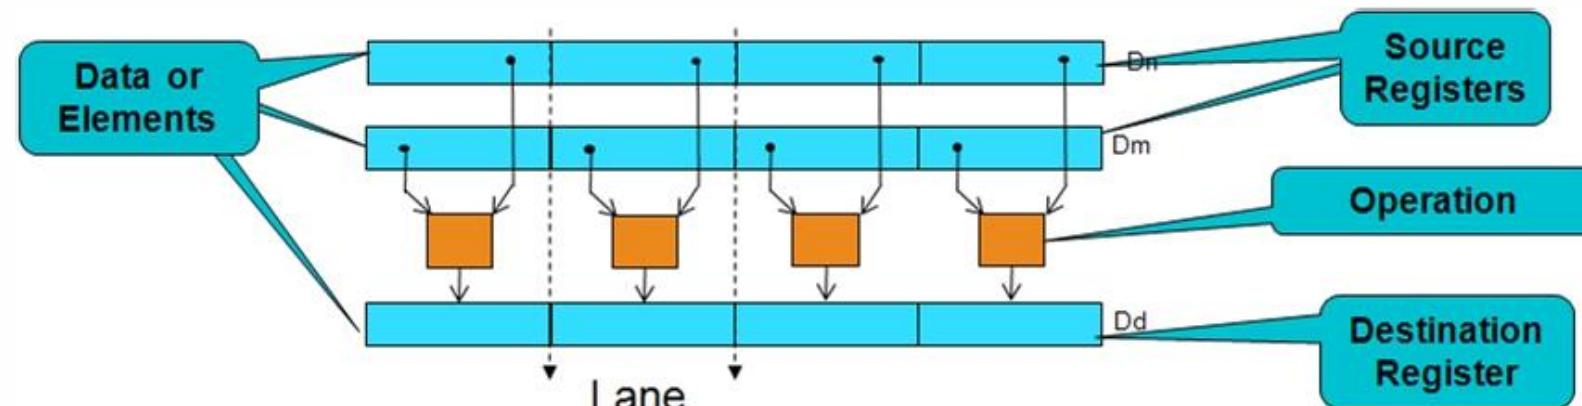

NEON™/FPU  
Engine

# NEON Instruction

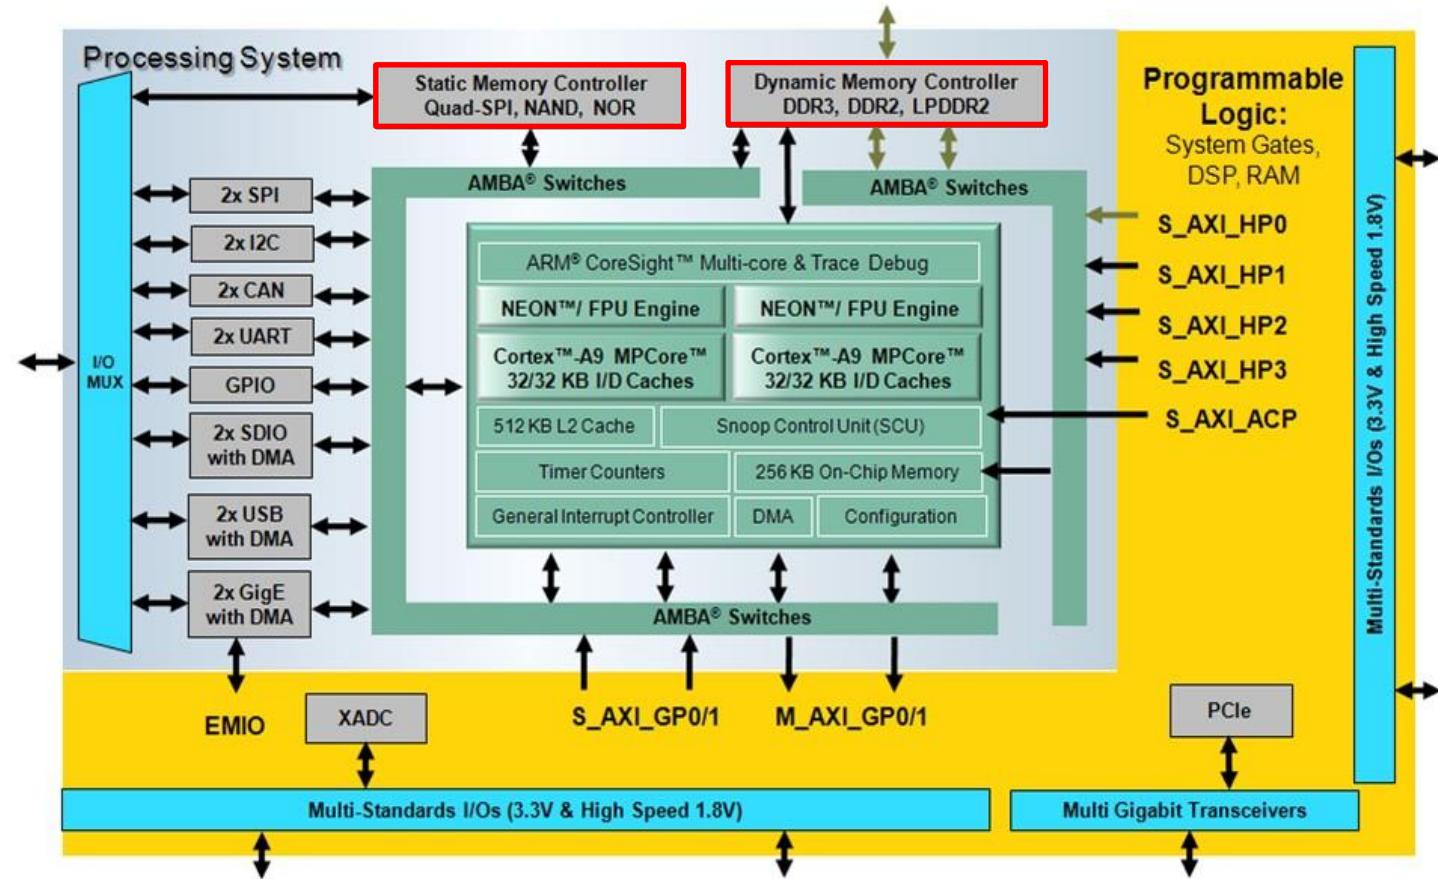

- Vector Processing using NEON
- Block-based data processing
- Audio, video, and image processing codes
- 2D graphics based on rectangular blocks of pixels
- 3D graphics
- Color-space conversion
- Physics simulations

NEON™/FPU  
Engine

# Processing System (PS) Components

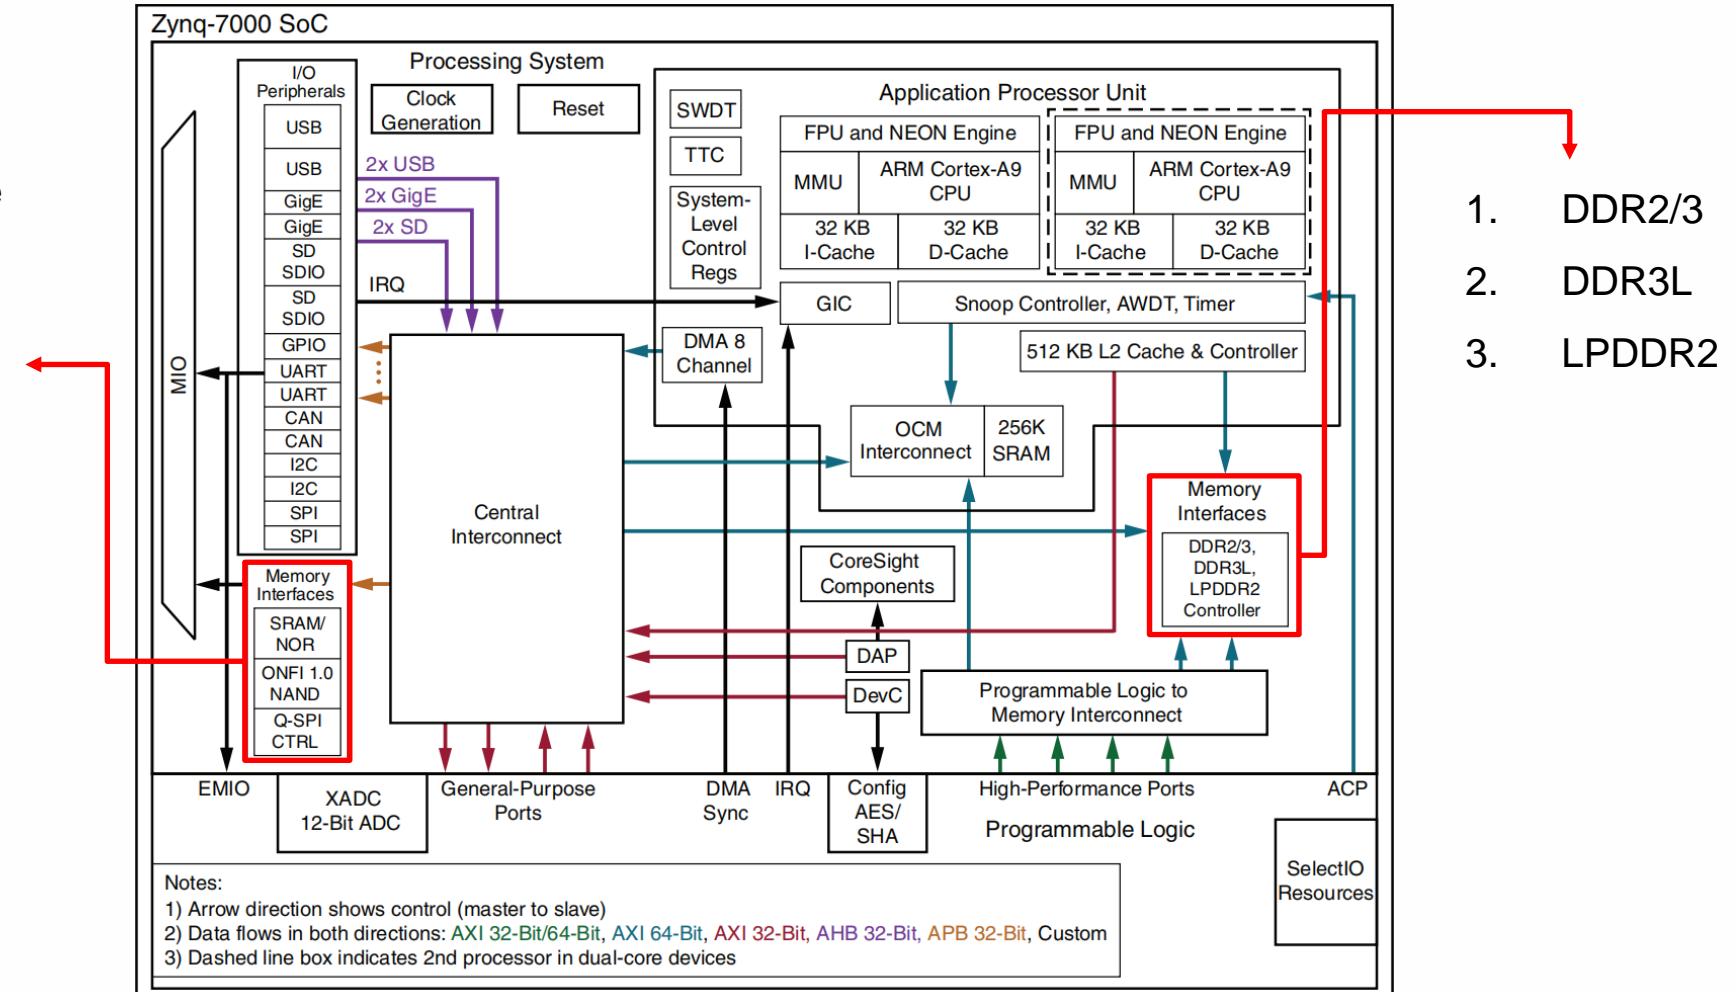

- Application processor unit (APU)
- Memory interfaces
- I/O peripherals (IOP)
- Interconnect

# Processing System (PS) Components

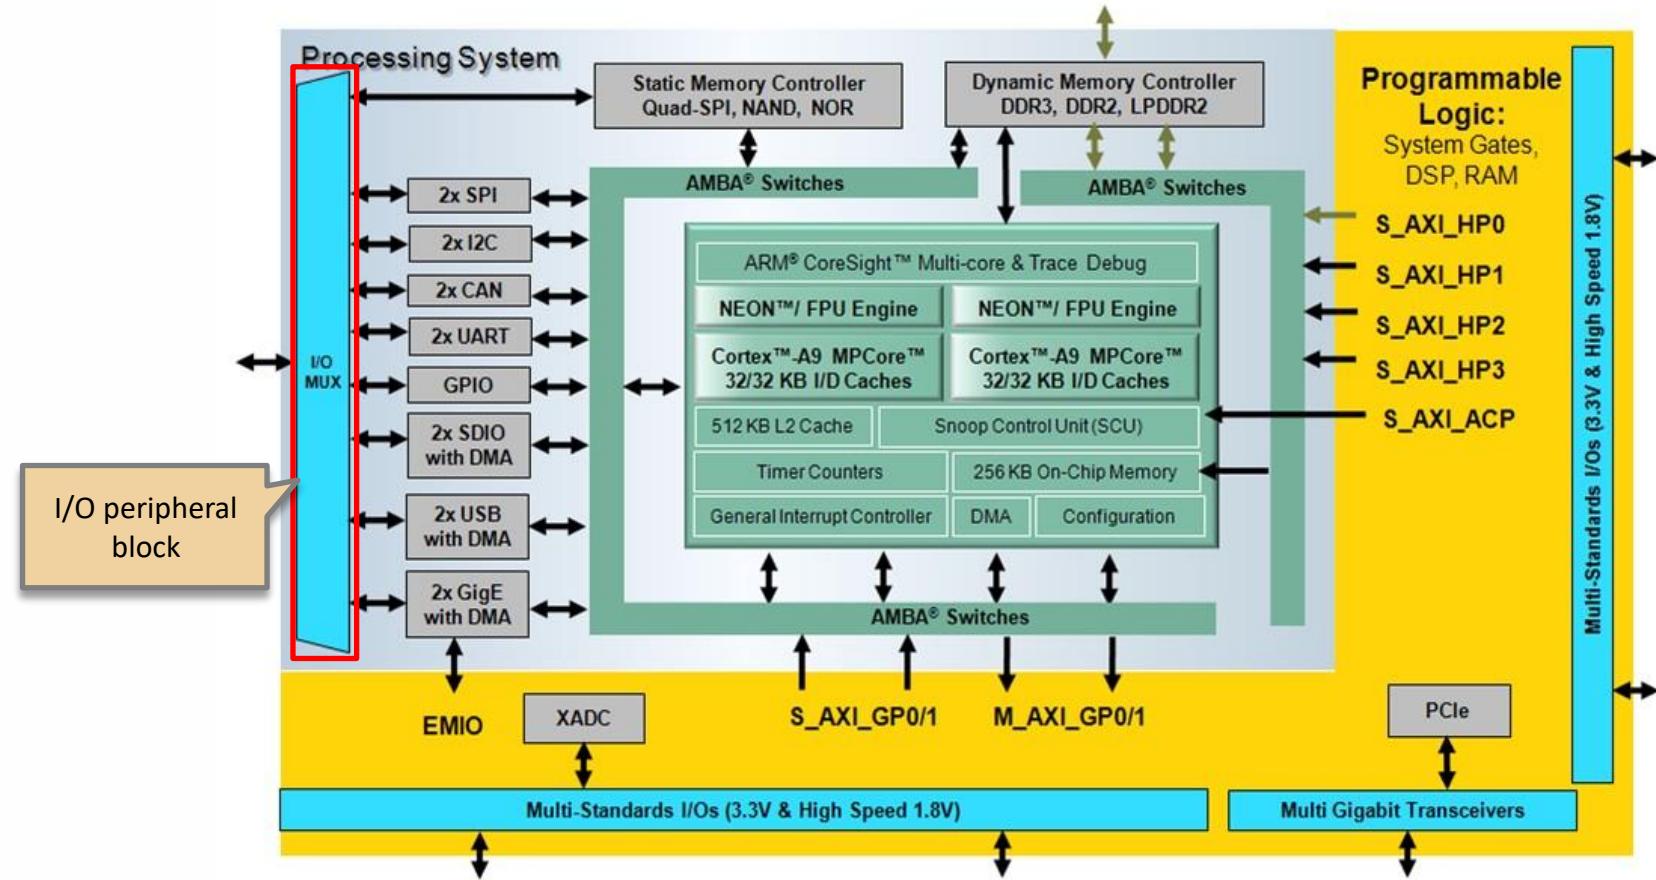

- Memory interfaces

- SRAM/NOR , SRAM interface
- ONFI 1.0 NAND  
( Open Nand Flash Interface )
- Q-SPI CTRL  
( Qual SPI control , quad-  
channel SPI FLASH interface )

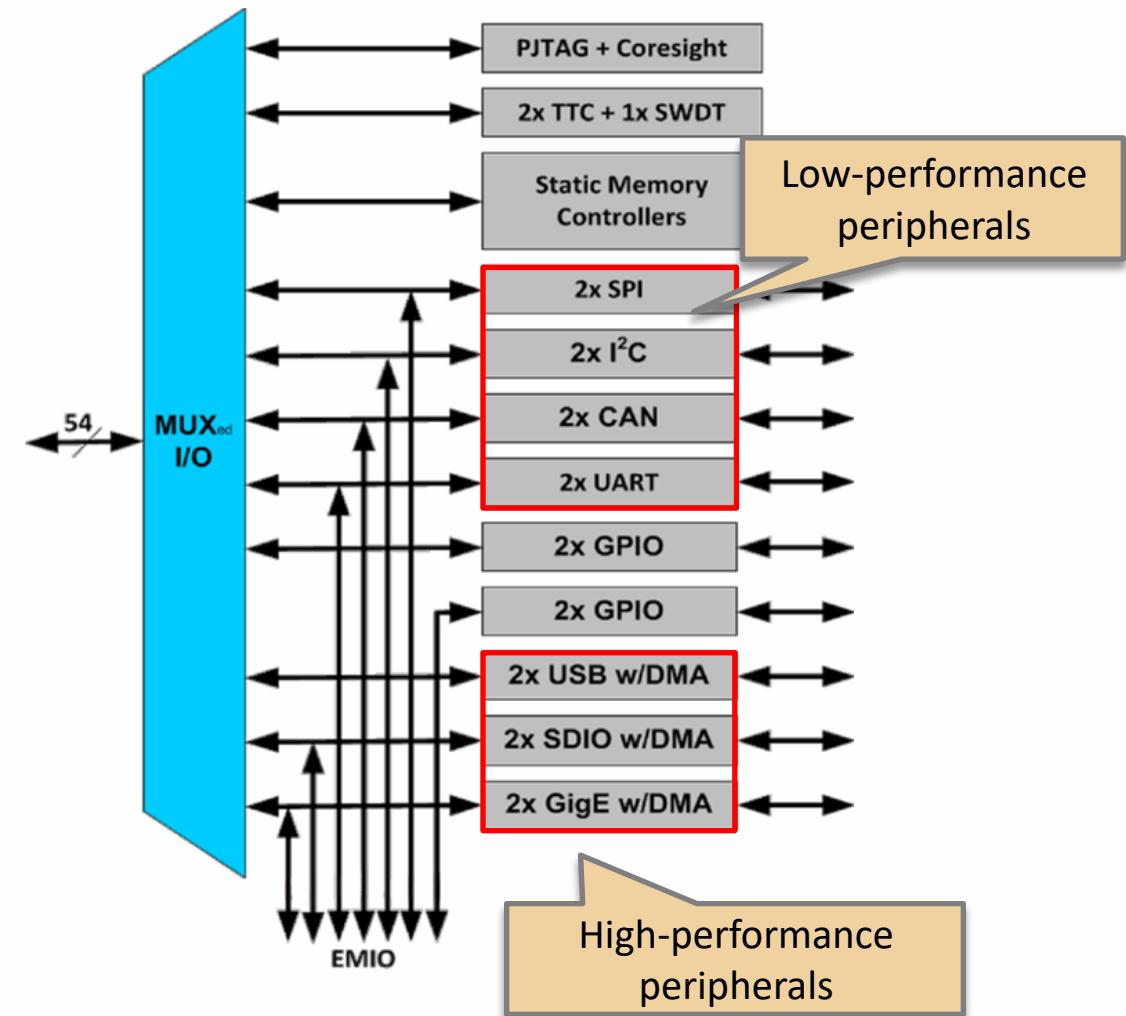

# Processing System (PS) Components

- Application processor unit (APU)
- Memory interfaces
- I/O peripherals (IOP)
- Interconnect

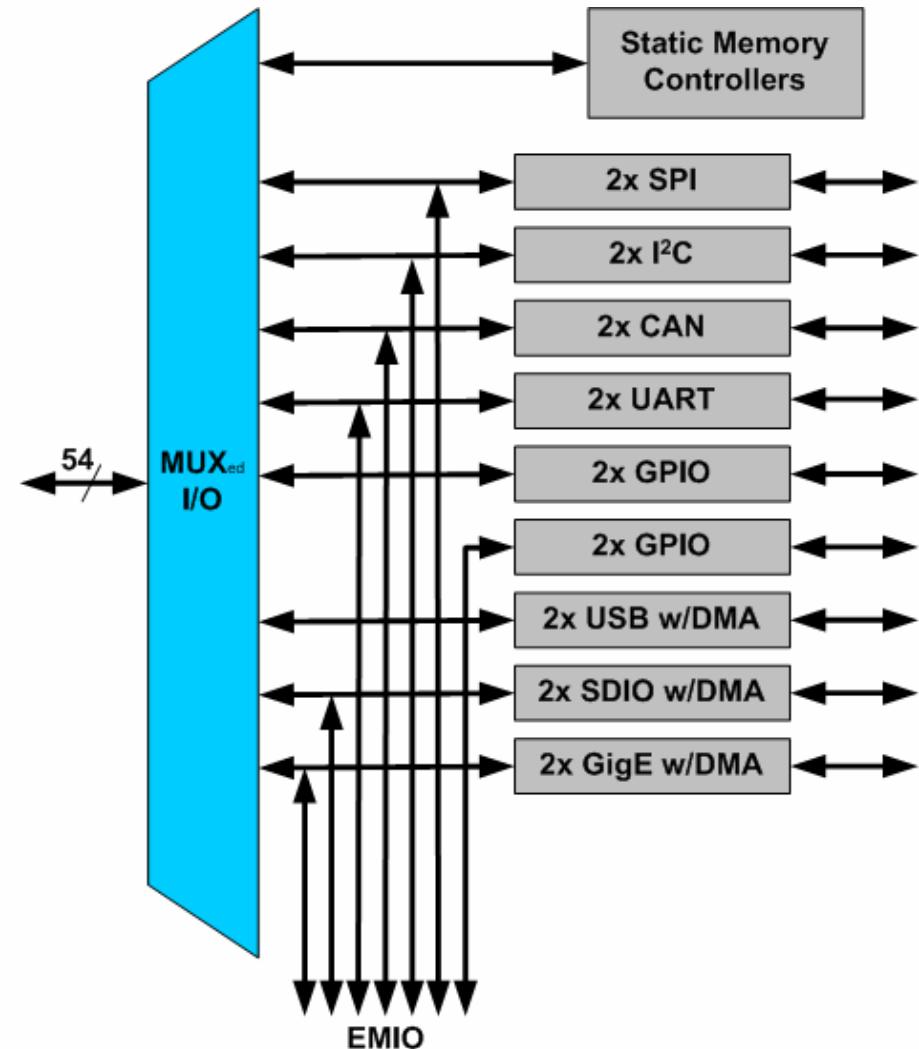

# Built-in Peripherals

- Two USB 2.0 OTG/device/host
- Two tri-mode gigabit Ethernet (10/100/1000)
- Two SD/SDIO interfaces
  - Memory, I/O, and combo cards
- Two CAN 2.0Bs, SPIs, I2Cs, UARTs
- Four GPIO 32-bit blocks
  - 54 available through MIO; other 64 available through EMIO

# Built-in Peripherals

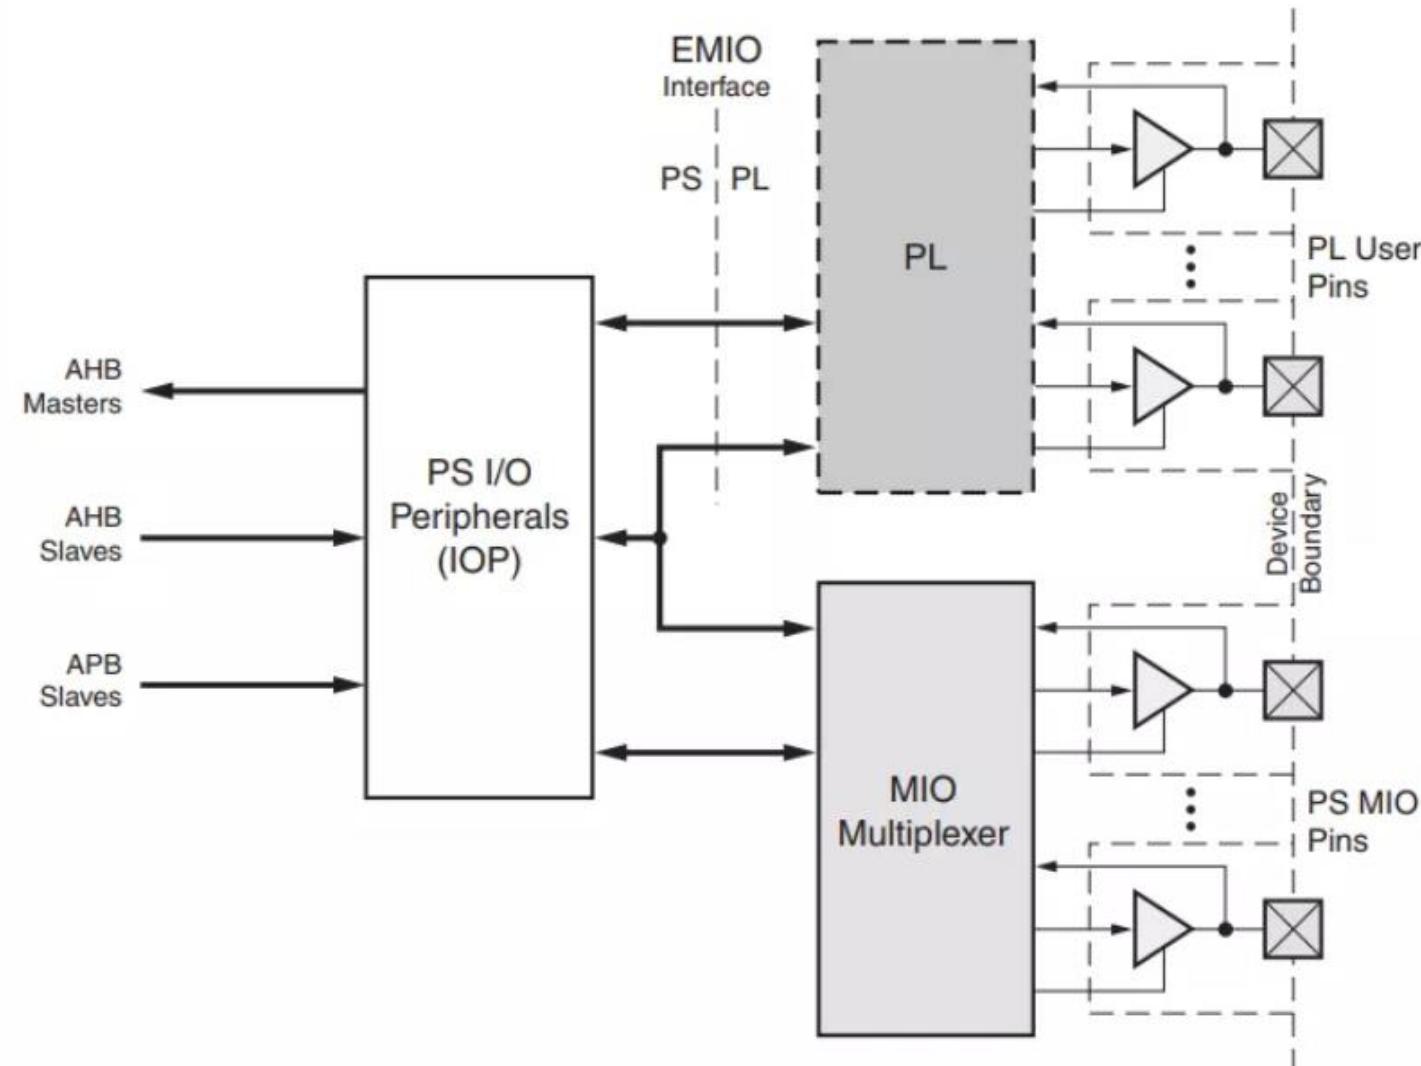

- Multiplexed input/output (MIO)
  - Multiplexed output of peripheral and static memories
  - Two I/O banks; each selectable: 1.8V, 2.5V, or 3.3V
  - Configured using configuration
  - Dedicated pins are used
- Extended MIO
  - Enables use of the SelectIO™ interface with PS peripherals
  - User constraints must be present for the signals brought out to the SelectIO pins

# MIO vs. EMIO

IP	MIO	Extendable MIO in Programmable Logic
QSPI NOR/SRAM NAND	Yes	No
USB:0,1	Yes, Phy off chip	No
SDIO:0,1	Yes – 50MHz	Yes – 25MHz
SPI:0,1 I2C:0,1 CAN:0,1 GPIO	Yes	Yes
GigE:0,1	RGMII v2.0 (HSTL) Phy off chip	Supports GMII, RGMII v2.0 (HSTL), RGMII v1.3 (LVCMOS), RMII, MII, SGMII with wrapper in Programmable Logic
UART:0,1	Simple UART: Only 2 pins (Tx & Rx)	Full UART (Tx, Rx, DTR, DCD, DSR, RI, RTS & CTS) either require: <ul style="list-style-type: none"><li>• 2 Processing System pins (Rx &amp; Tx) through MIO + 6 additional Programmable Logic pins</li><li>• 8 Programmable Logic pins</li></ul>

# MIO vs. EMIO

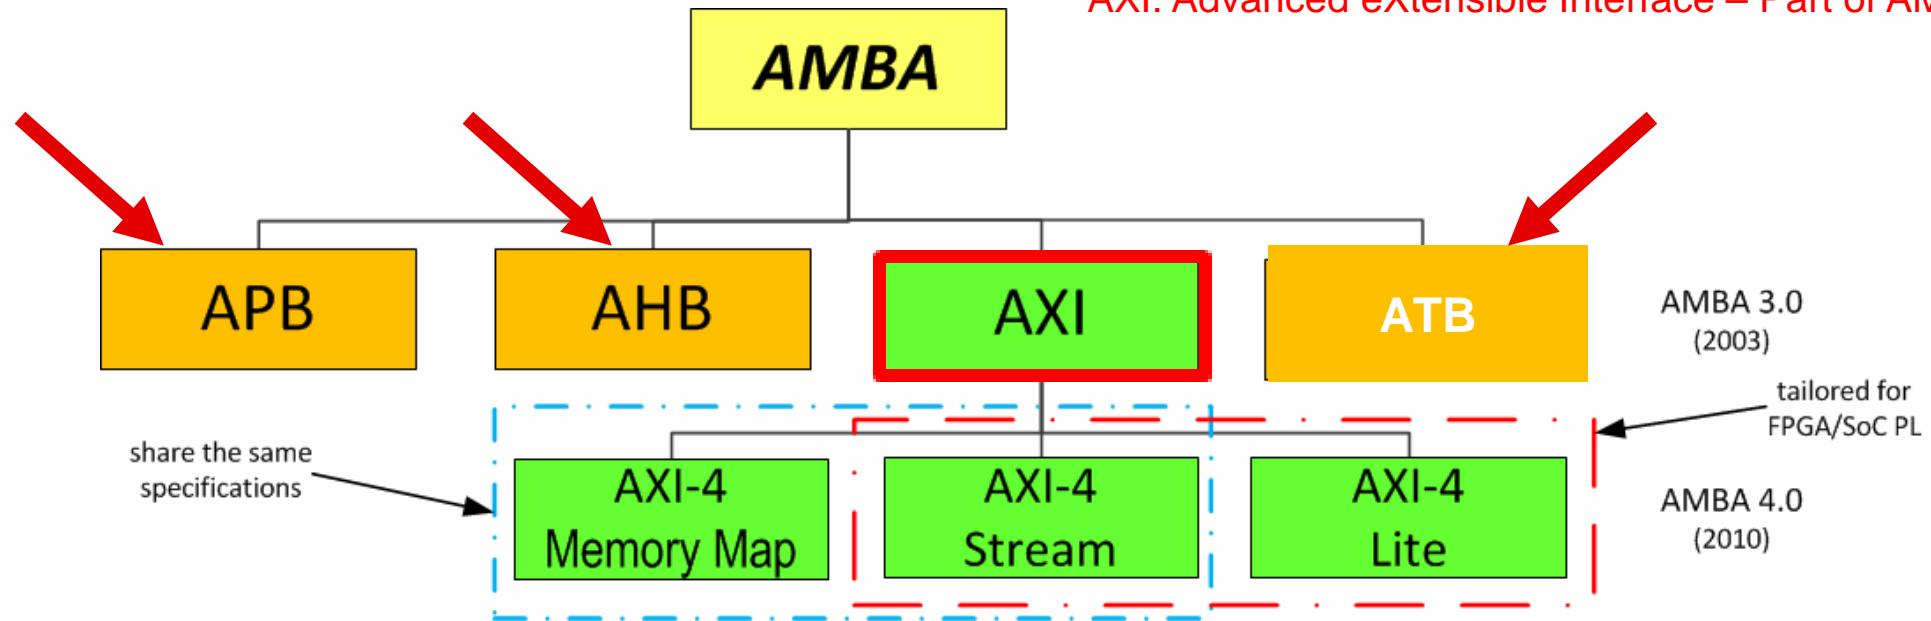

UG585\_c2\_02\_101612

# Advanced eXtensible Interface (AXI) Bus

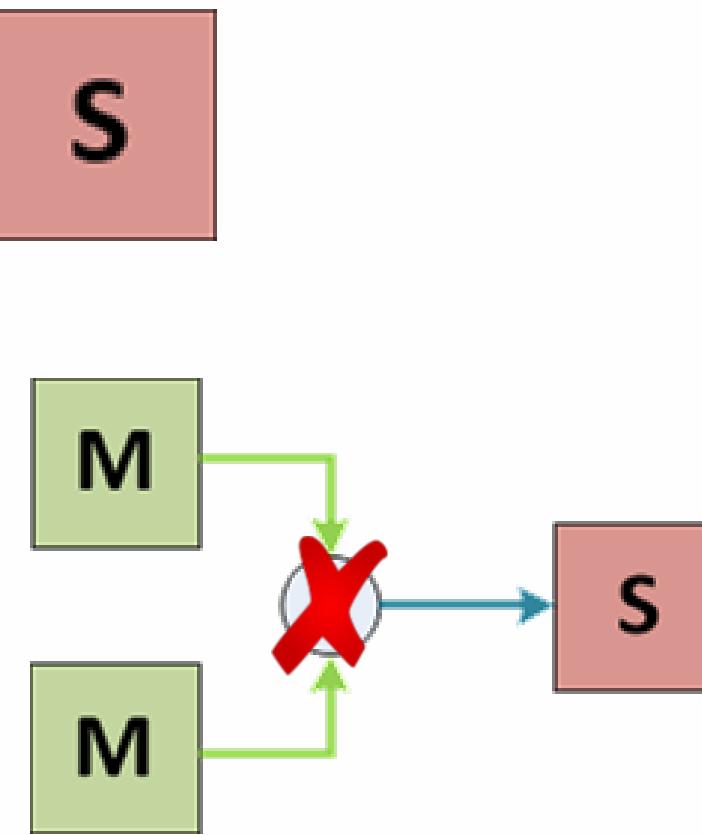

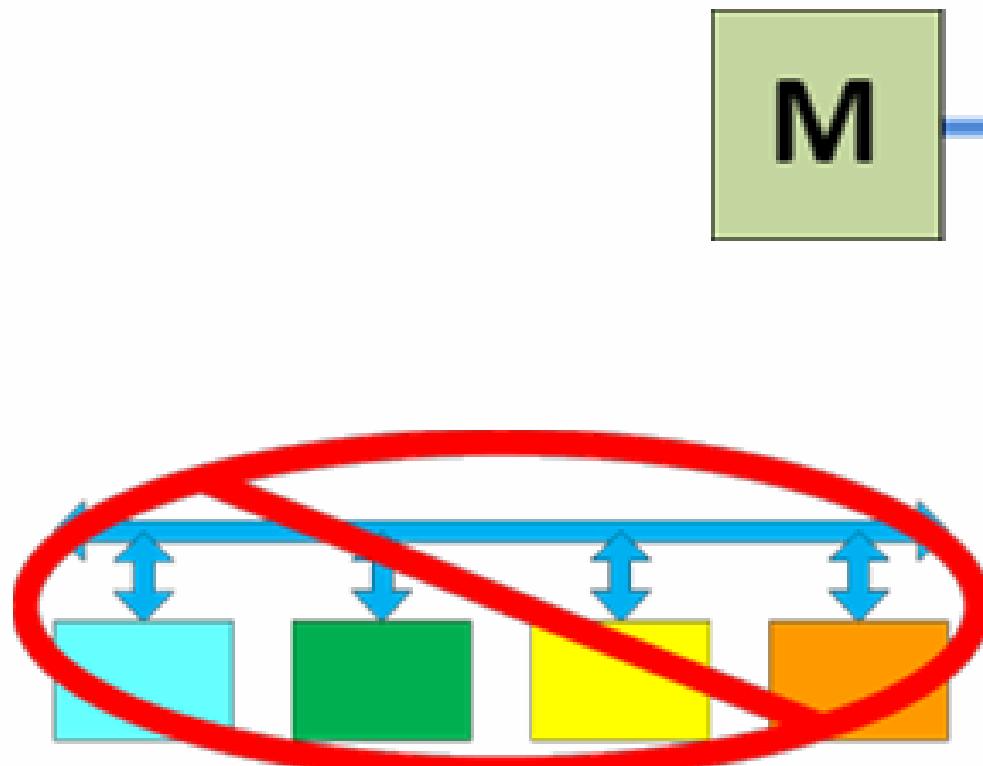

AMBA: Advanced Microcontroller Bus Architecture

AXI: Advanced eXtensible Interface – Part of AMBA

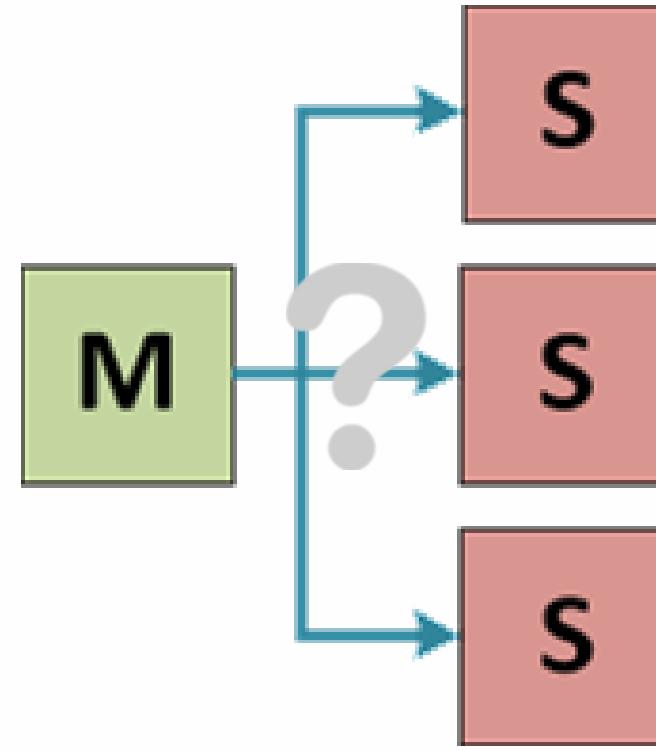

- APB, AHB, and ATB are used for internal Arm® core topologies, AXI is targeted towards processor peripherals and other IP through the programmable logic.
- Unified interface protocol of Xilinx components.

# Advanced eXtensible Interface (AXI) Bus

- AXI defines a point-to-point connection, there are never any bus arbitration issues.
- One master port talks to only one slave port.

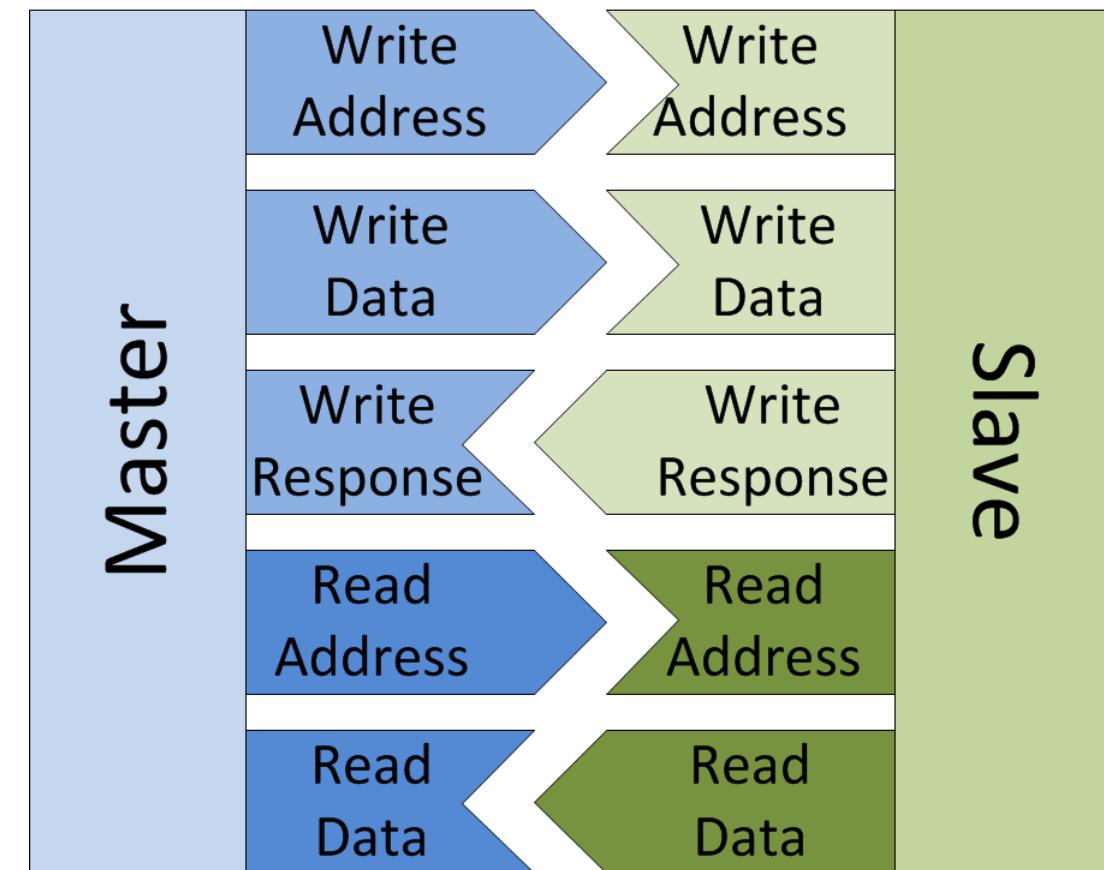

# Advanced eXtensible Interface (AXI) Bus

- **AXI interconnect IP** refers to a piece of IP that resides in the PL and takes its input from a single AXI slave and maps it to one or more AXI masters. This then allows a single PS master port to connect to multiple slave devices.

# Advanced eXtensible Interface (AXI) Bus

- Definition
  1. Separate address, control, and data phases
  2. Unaligned data transfers
  3. Burst transactions
  4. Multiple outstanding reads

# Advanced eXtensible Interface (AXI) Bus

- Definition
  1. Separate address, control, and data phases
  2. Unaligned data transfers

e.g.

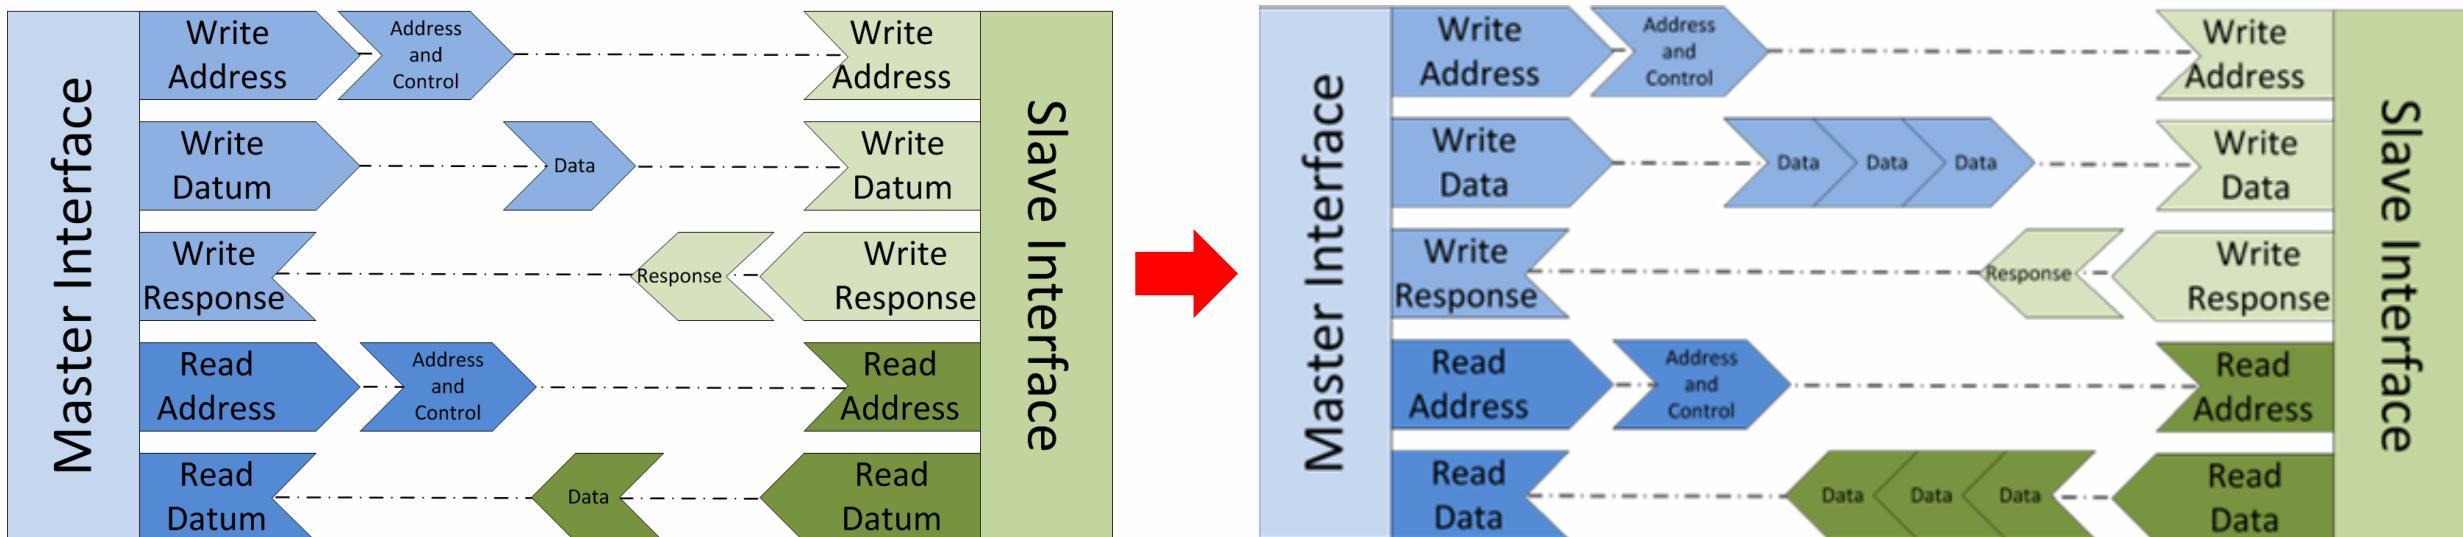

Address: 0x01  
Transfer size: 32 bits  
Burst type: incrementing  
Burst length: 5 transfers

3	2	1	0	1st transfer
7	6	5	4	2nd transfer
B	A	9	8	3rd transfer
F	E	D	C	4th transfer
13	12	11	10	5th transfer

3. Burst transactions
4. Multiple outstanding reads

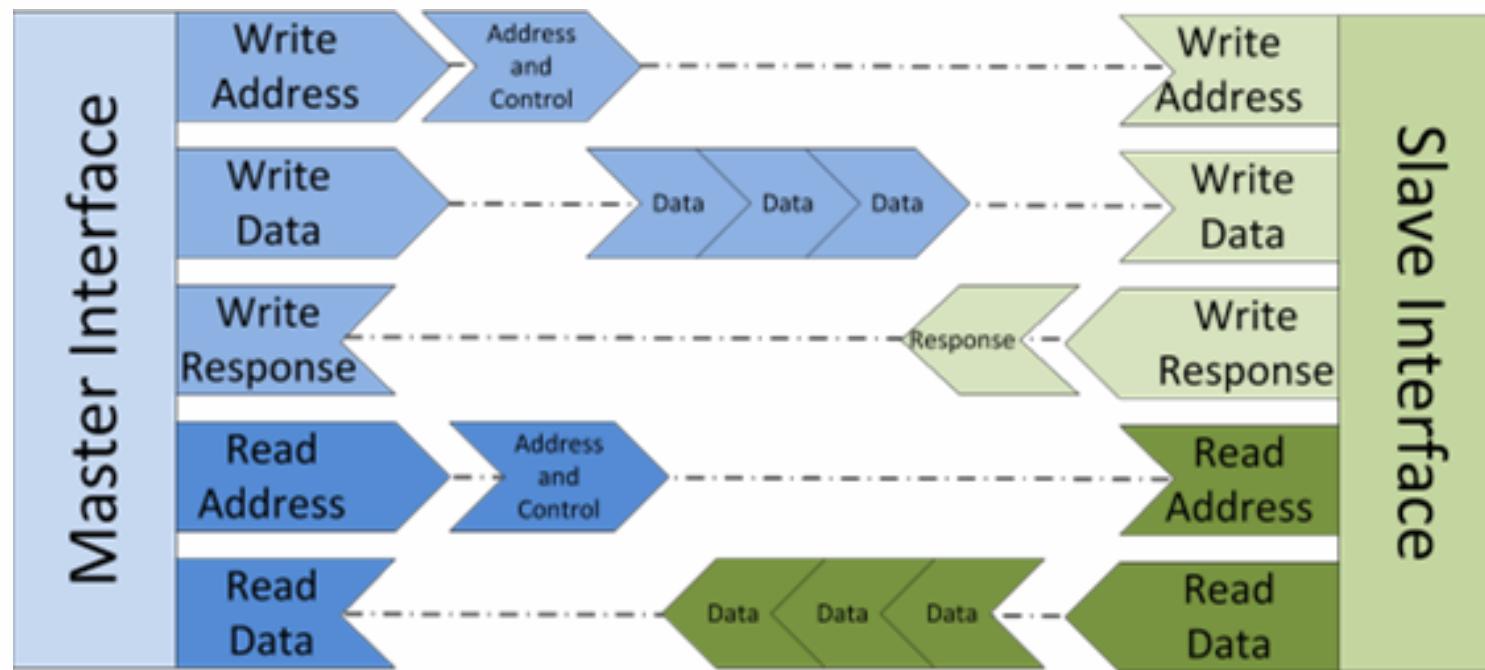

# Advanced eXtensible Interface (AXI) Bus

- Definition
  - 1. Separate address, control, and data phases
  - 2. Unaligned data transfers
  - 3. Burst transactions
  - 4. Multiple outstanding reads

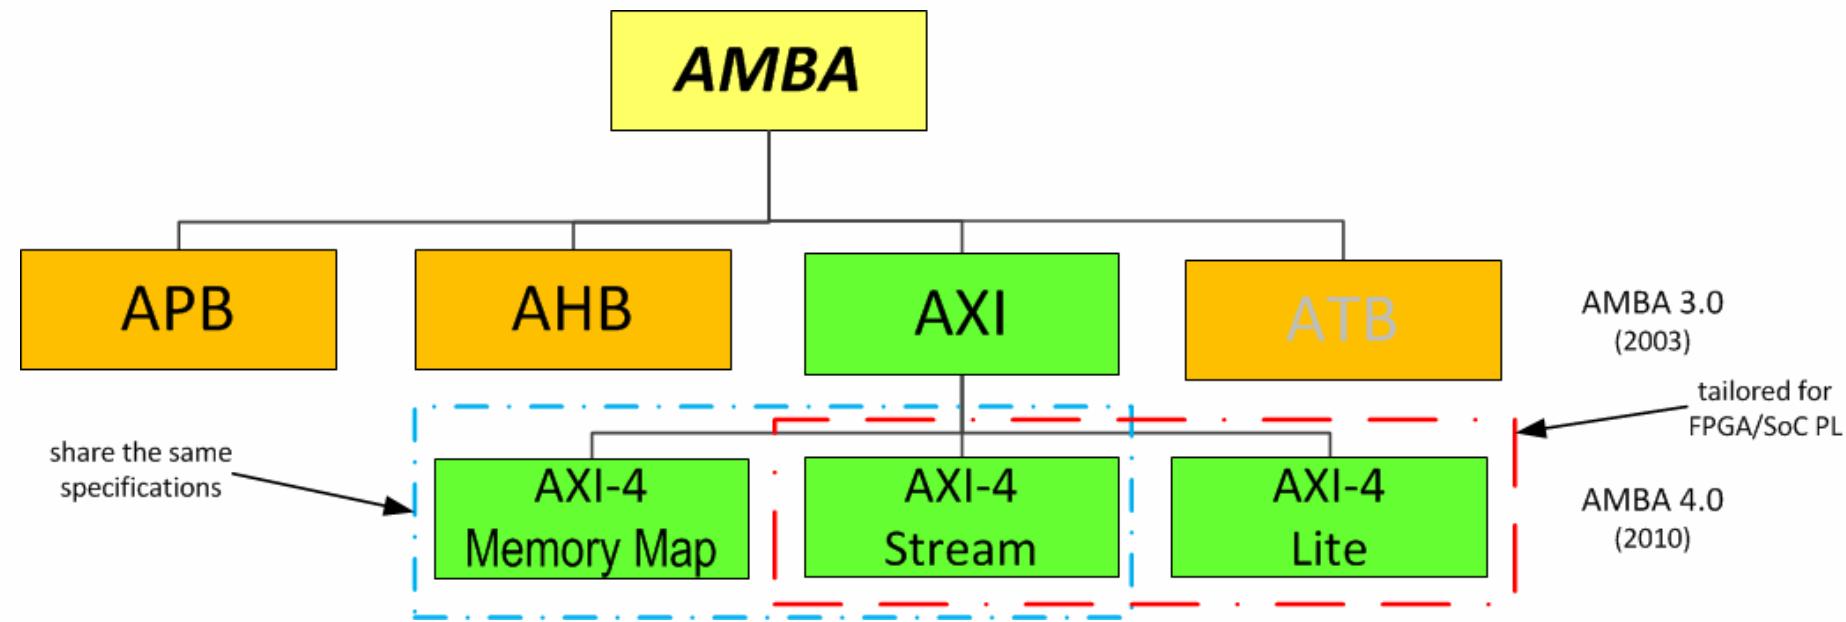

# Advanced eXtensible Interface (AXI) Bus

- Definition
  1. Separate address, control, and data phases
  2. Unaligned data transfers
  3. Burst transactions
  4. Multiple outstanding reads

# Advanced eXtensible Interface (AXI) Bus

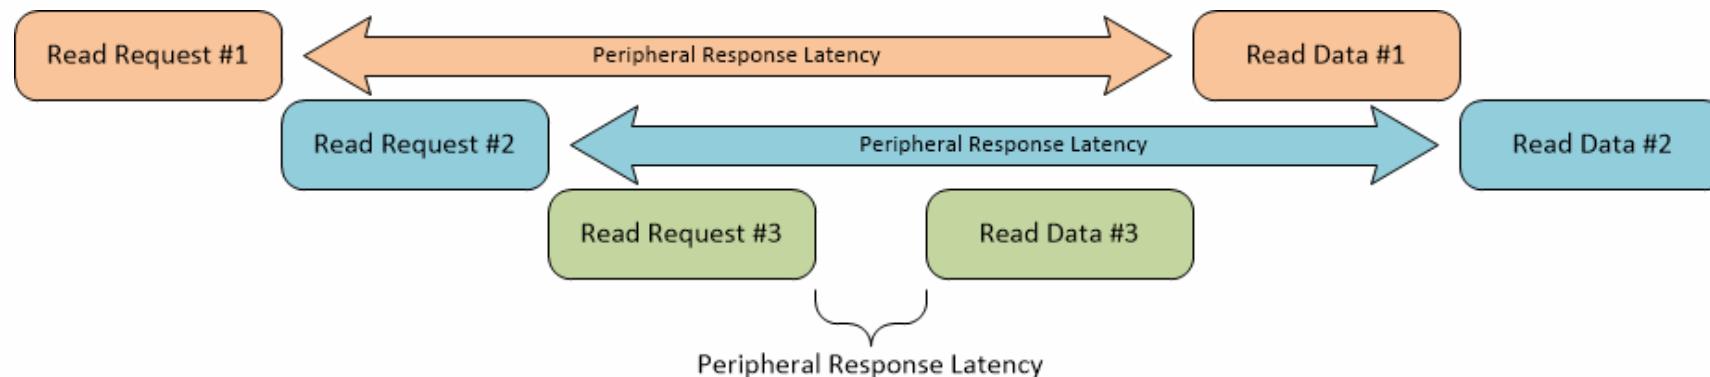

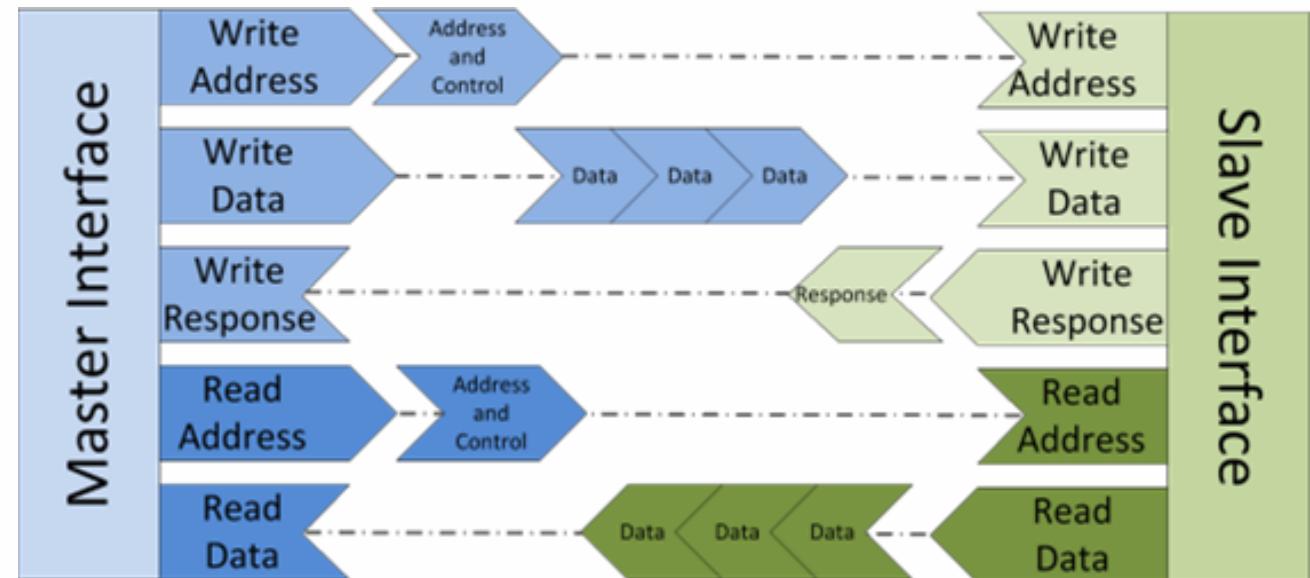

Interface	Features
Memory Map / Full	Traditional address/data burst (single address, multiple data)
Streaming	Data only, streaming, <b>usually are used for video and audio data transfer</b>
Lite	Traditional address/data—no burst (single address, single data only)

# Advanced eXtensible Interface (AXI) Bus

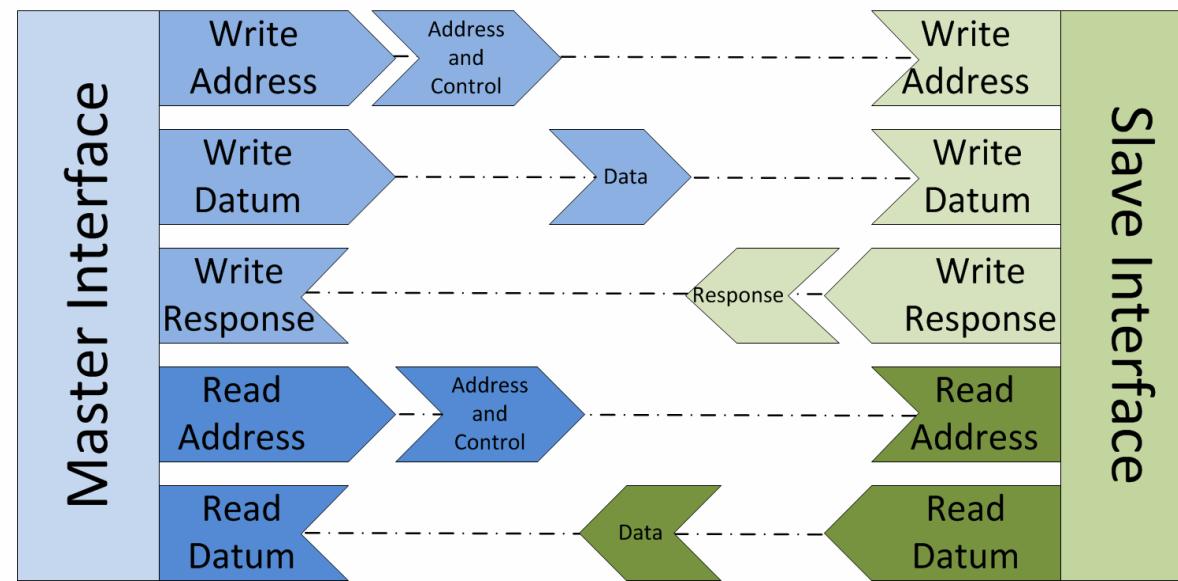

- AXI Memory Map / Full

1. Single address multiple data
2. Burst up to 256 data beats
3. Data width parameterizable
  - 32, 64, 128, 256, 512, 1024 bits
4. Support for overlapped transactions

# Advanced eXtensible Interface (AXI) Bus

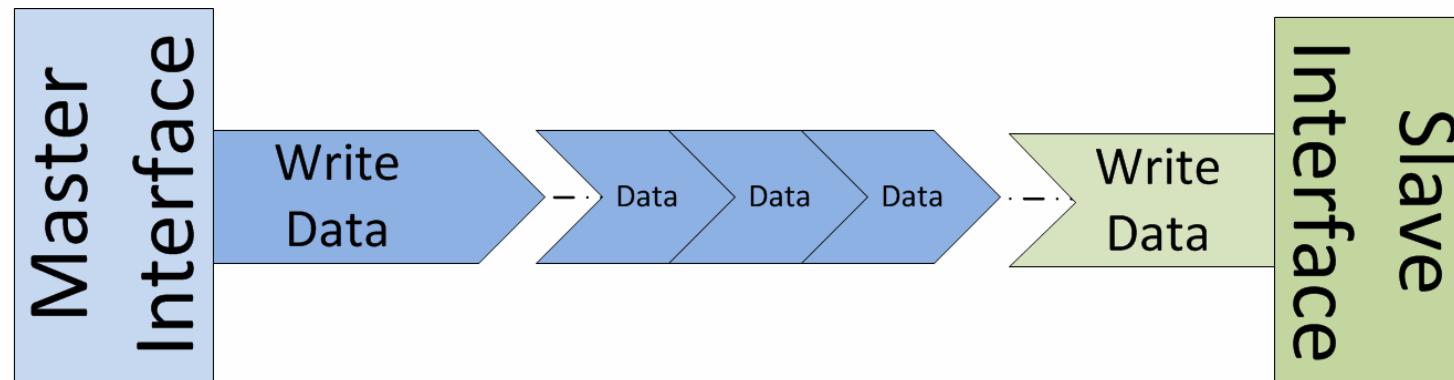

- AXI Lite
  - 1. Subset of the AXI interface
  - 2. Supports simple component interfaces, save power and spaces
  - 3. Main purpose
    - Enable the processors to communicate control signals and messages with peripheral registers.
  - 4. Implementation widths are selectable as either 32-bits wide or 64-bits wide.

# Advanced eXtensible Interface (AXI) Bus

- **AXI Streaming**

1. Transfer – Single datum moving across AXI-Stream interface. Defined by TVALID-TREADY handshake
2. Packet – Group of bytes, is like an **AXI “burst”**
3. Frame – Integer number of packets
4. Stream – Transport of data from source to destination

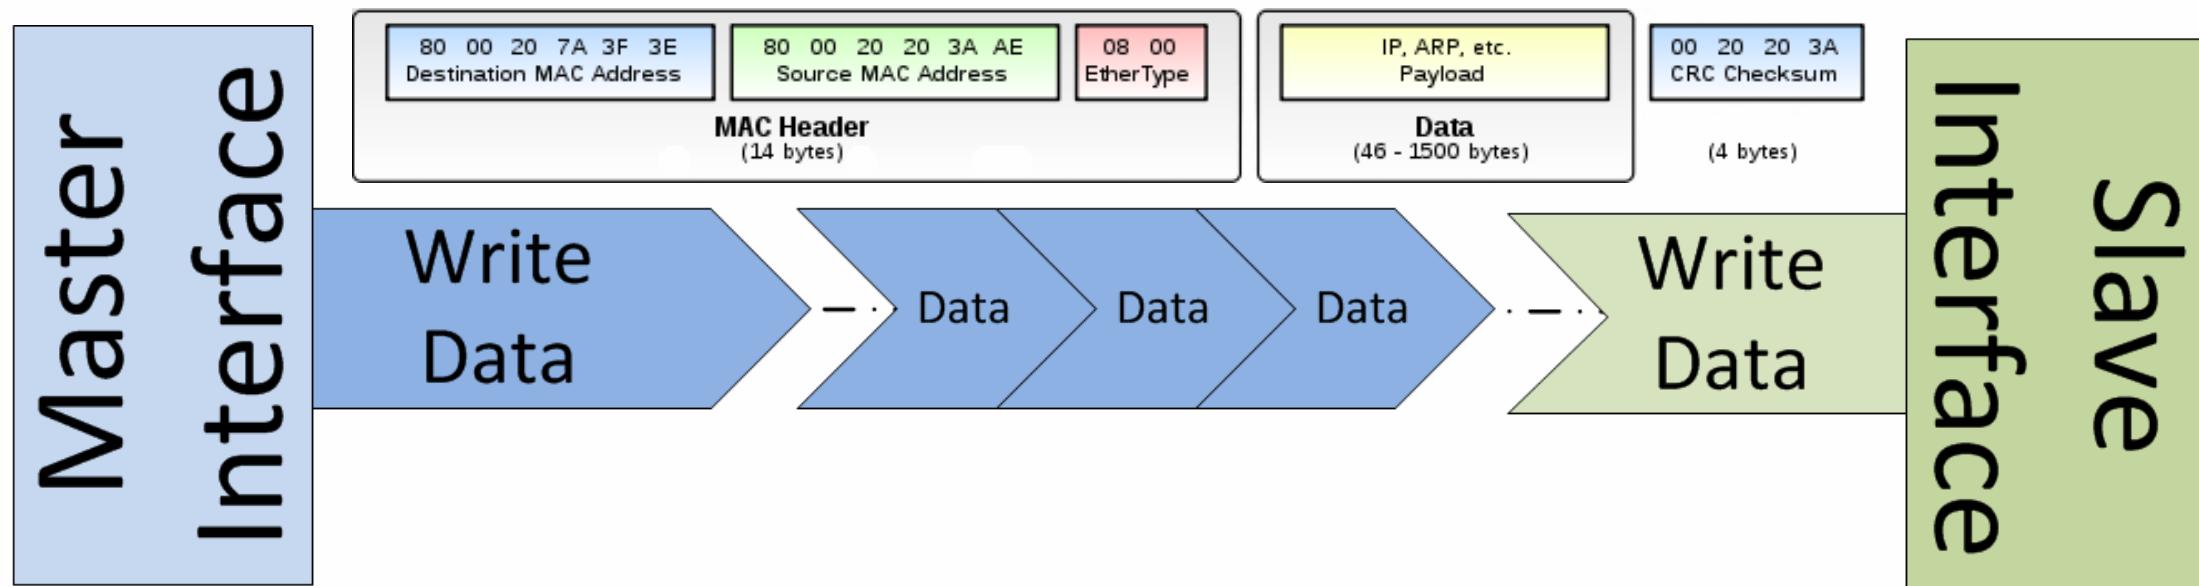

1. Data Only
2. Minimum control
3. Unlimited burst length
4. Only a single direction

# Advanced eXtensible Interface (AXI) Bus

- AXI Streaming

1. Data Only
2. Minimum control
3. Unlimited burst length
4. Only a single direction

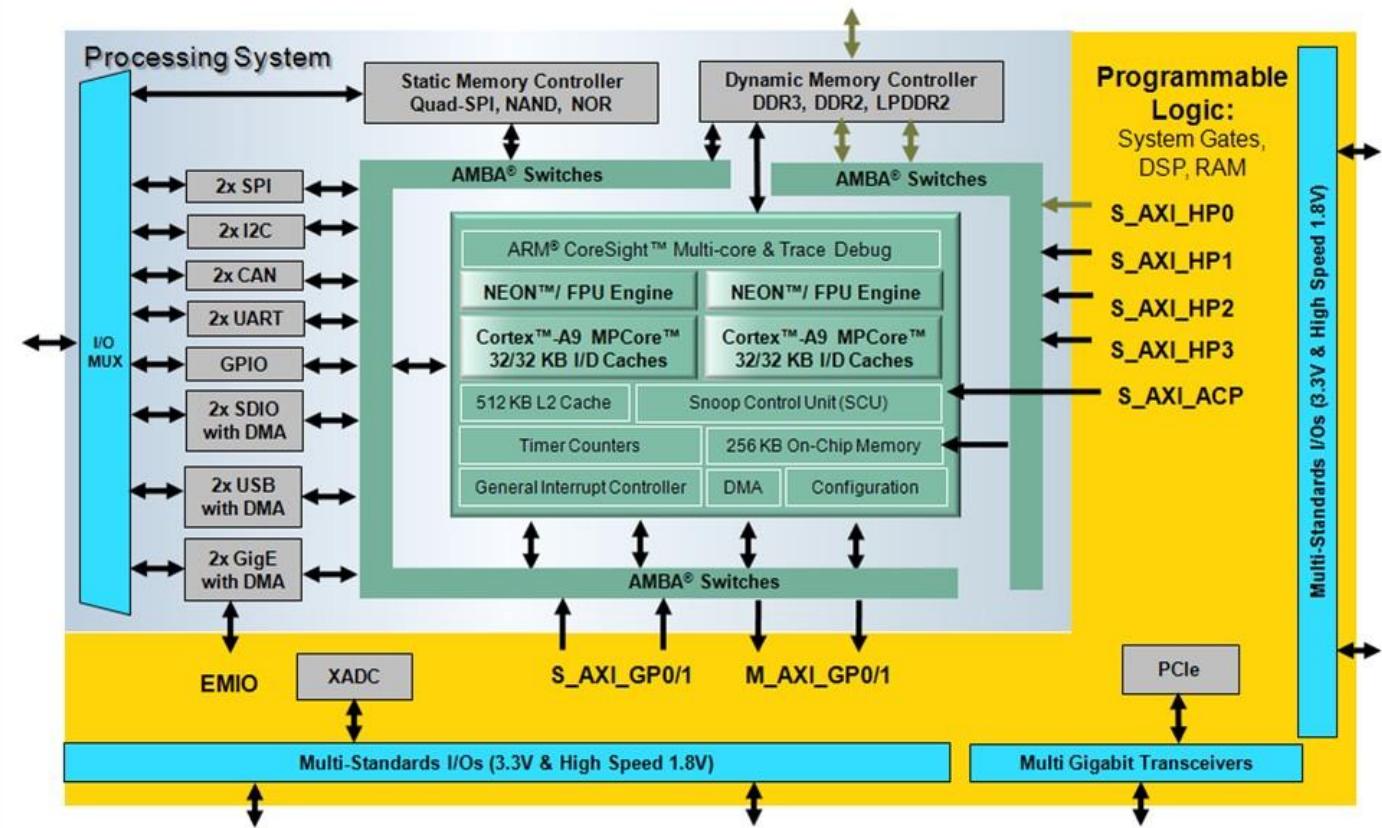

# PS-PL Interfaces

## ➤ AXI high-performance slave ports (HP0-HP3)

- Configurable 32-bit or 64-bit data width
- Access to OCM and DDR only
- Conversion to processing system clock domain
- AXI FIFO Interface (AFI) are FIFOs (1KB) to smooth large data transfers

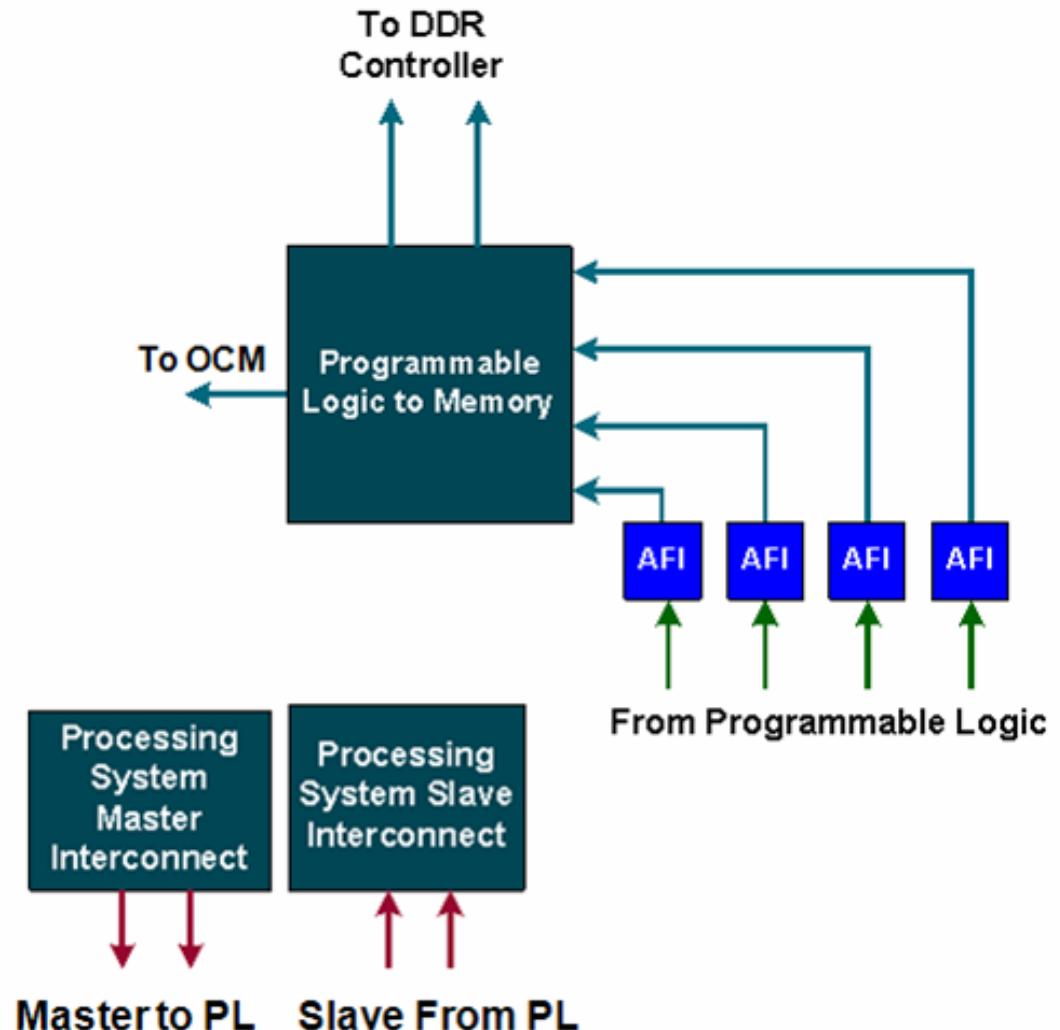

## ➤ AXI general-purpose ports (GP0-GP1)

- Two masters from PS to PL
- Two slaves from PL to PS
- 32-bit data width
- Conversation and sync to processing system clock domain

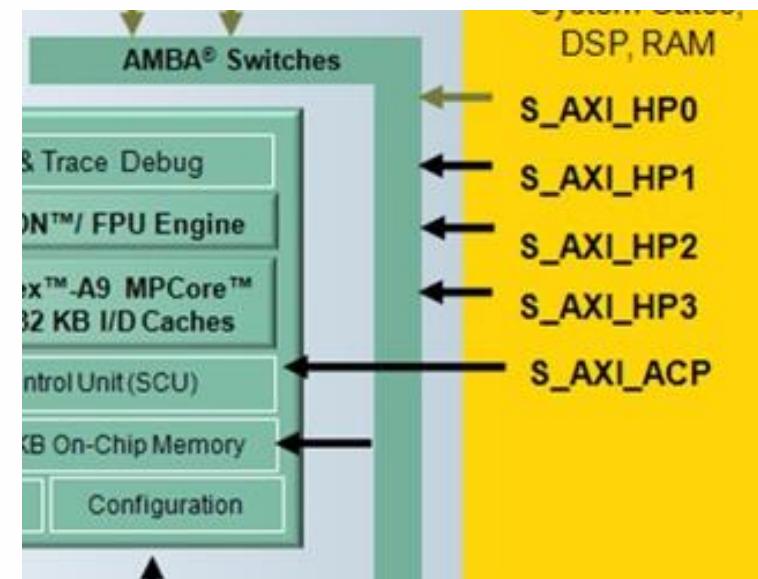

# PS-PL Interfaces

- AXI high-performance slave ports (HP0-HP3)
  - Configurable 32-bit or 64-bit data width
  - Access to OCM and DDR only
  - Conversion to processing system clock domain
  - AXI FIFO Interface (AFI) are FIFOs (1KB) to smooth large data transfers
- AXI general-purpose ports (GP0-GP1)
  - Two masters from PS to PL
  - Two slaves from PL to PS
  - 32-bit data width
  - Conversation and sync to processing system clock domain

# PS-PL Interfaces

- One 64-bit accelerator coherence port (ACP) AXI slave interface to CPU memory
- DMA, interrupts, events signals
  - Processor event bus for signaling event information to the CPU
  - PL peripheral IP interrupts to the PS general interrupt controller (GIC)
  - Four DMA channel RDY/ACK signals
- Extended multiplexed I/O (EMIO) allows PS peripheral ports access to PL logic and device I/O pins
- Clock and resets
  - Four PS clock outputs to the PL with enable control
  - Four PS reset outputs to the PL
- Configuration and miscellaneous

# PS-PL Interfaces

- One 64-bit accelerator coherence port (ACP) AXI slave interface to CPU memory
- DMA, interrupts, events signals
  - Processor event bus for signaling event information to the CPU
  - [PL peripheral IP interrupts to the PS general interrupt controller \(GIC\)](#)
  - Four DMA channel RDY/ACK signals
- Extended multiplexed I/O (EMIO) allows PS peripheral ports access to PL logic and device I/O pins
- Clock and resets
  - Four PS clock outputs to the PL with enable control
  - Four PS reset outputs to the PL
- Configuration and miscellaneous

Type	PL Signal Name	I/O	Destination
PL to PS Interrupts	IRQF2P[7:0]	I	SPI: Numbers [68:61].
	IRQF2P[15:8]	I	SPI: Numbers [91:84].
	IRQF2P[19:16]	I	PPI: nFIQ, nIRQ (both CPUs).
PS to PL Interrupts	IRQP2F[27:0]	O	PI Logic. These signals are received from the I/O peripherals and are forwarded to the interrupt controller. These signals are also provided as outputs to the PL.

# PS-PL Interfaces

- One 64-bit accelerator coherence port (ACP) AXI slave interface to CPU memory
- DMA, interrupts, events signals
  - Processor event bus for signaling event information to the CPU
  - PL peripheral IP interrupts to the PS general interrupt controller (GIC)
  - Four DMA channel RDY/ACK signals
- Extended multiplexed I/O (EMIO) allows PS peripheral ports access to PL logic and device I/O pins
- **Clock and resets**
  - Four PS clock outputs to the PL with enable control
  - Four PS reset outputs to the PL
- Configuration and miscellaneous

Type	PL Signal Name	I/O	Reference
PL Clocks	FCLKCLK[3:0]	O	<a href="#">Chapter 25, Clocks</a>
PL Clock Throttle Control	FCLKCLKTRIG [3:0]	I	
PL Resets	FCLKRESETN [3:0]	O	<a href="#">Chapter 26, Reset System</a>

# PS Clocking Sources

## ➤ PS clocks

- PS clock source from external package pin
- PS has three PLLs for clock generation
- PS has four clock ports to PL

## ➤ PL clocking resources

- PL has a different clock source domain compared to the PS
- The clock to PL can be sourced from external clock capable pins
- Can use one of the four PS clocks as source

## ➤ Synchronizing the clock between PL and PS is taken care by the architecture of the PS

## ➤ PL cannot supply clock source to PS

# Resets

## ➤ Internal resets

- Power-on reset (POR)
- Watchdog resets from the three watchdog timers

## ➤ PS resets

- External reset: PS\_SRST\_B
- Warm reset: SRSTB

## ➤ PL resets

- Four reset outputs from PS to PL
- FCLK\_RESET[3:0]

Reset Type	POR	Non-POR
Sample Pin Straps	Yes	No
Initialize PS PLLs <sup>(1)</sup>	Yes, by the hardware	Yes, by the BootROM
PS RAM (FIFOs, buffers, etc.)	Cleared	Cleared
IOP clocks	Disabled	Disabled
BootROM executes	Yes	Yes
Retains previous boot mode	No	Yes
Reboot Status register	Resets it	Accumulates the system reset type.
Device Registers	All	Persistent registers. <sup>(2)</sup>
Resets PL	Yes	Yes

# Zynq Boot and Configuration

## ➤ Zynq devices can be booted and/or configured in

- Secure mode via static memories only (JTAG excluded)
  - Ability to have secure software
  - Protects bitstream and IP
- Non-secure mode via JTAG or static memories (debug and development environment)
  - Standard boot model

## ➤ Four master boot devices

- QSPI: serial memory, linear addressing
- NAND: complex parallel memory
- NOR: parallel memory, linear addressing
- SD: Flash memory card

## ➤ Secondary boot devices

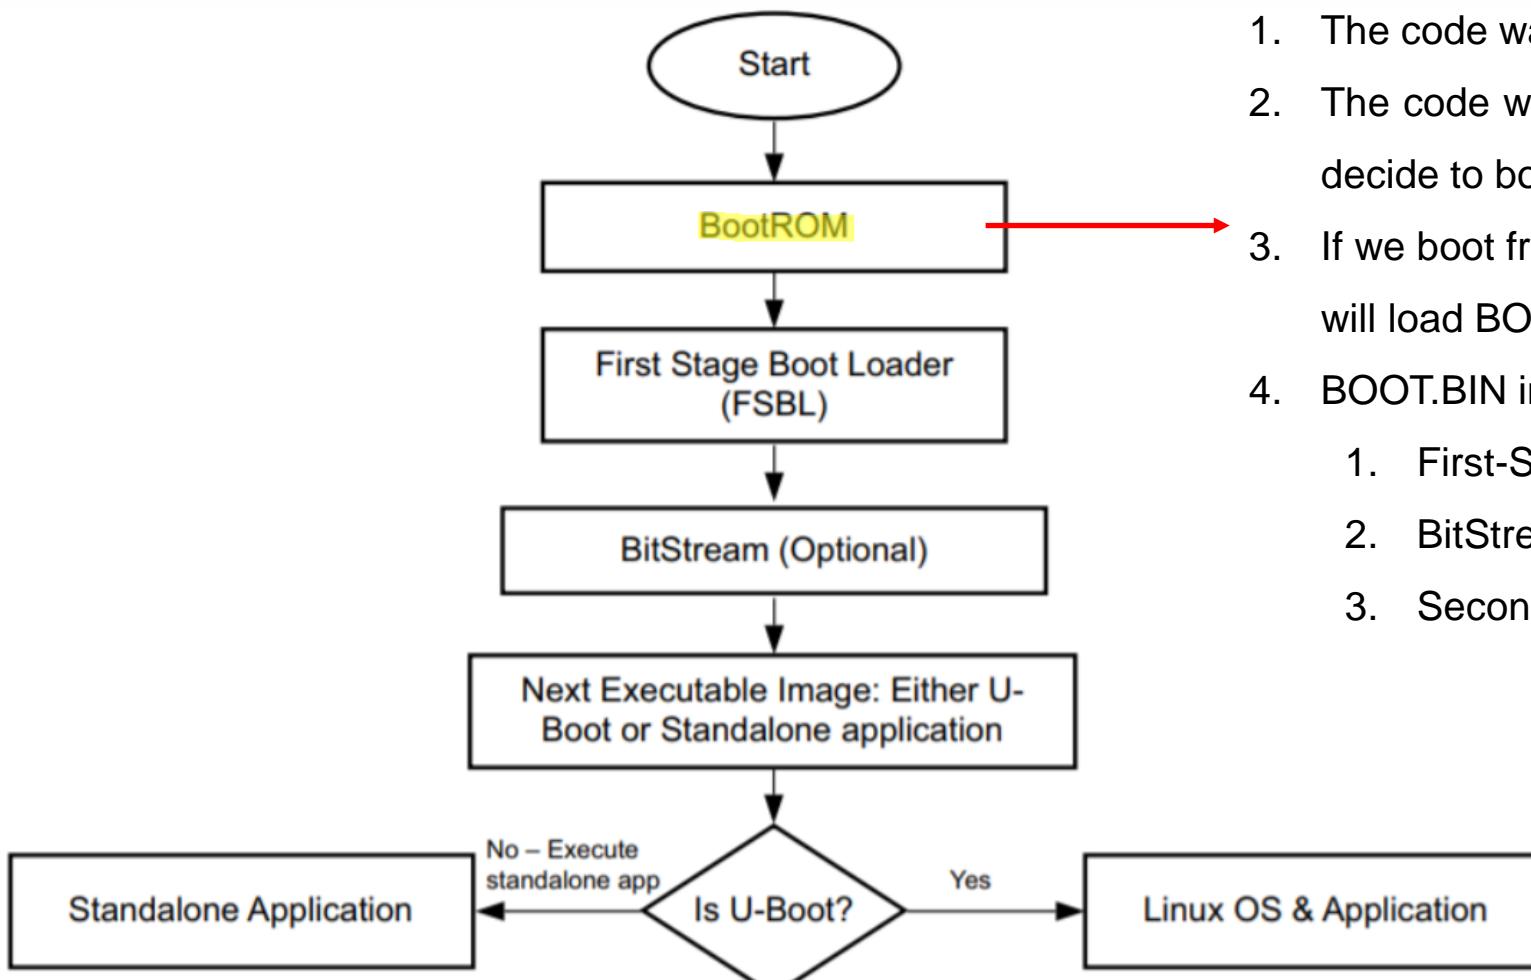

- USB, Ethernet, and most other peripherals

# Zynq Boot and Configuration

- Multi-stage boot process
  - **Stage 0: Runs from ROM; loads from non-volatile memory to OCM**
    - Provided by Xilinx; unmodifiable
  - **Stage 1: Runs from OCM; loads from non-volatile memory to DDRx memory**
    - User developed; Xilinx offers example code through SDK project
    - Initiates PS boot and PL configuration
  - **Stage 2: Optional; runs from DDR**
    - User developed; Xilinx offers example code – U-boot
    - Sourced from flash memory or through common peripherals, programmable logic I/O, etc.
  - Programmable logic configuration can be performed in Stage 1 or 2

# Zynq Boot and Configuration

- Multi-stage boot process

1. The code was pre-built by Xilinx will be executed in BootRom
2. The code will check the state of current BootMode Pins, then decide to boot from where
3. If we boot from SD Card, then the Boot Loader from BootRom will load BOOT.BIN which in SD Card to OCM
4. BOOT.BIN includes:
  1. First-Stage Boot Loader
  2. BitStream File (PL Logic Configuration)
  3. Second-Stage Boot Loader

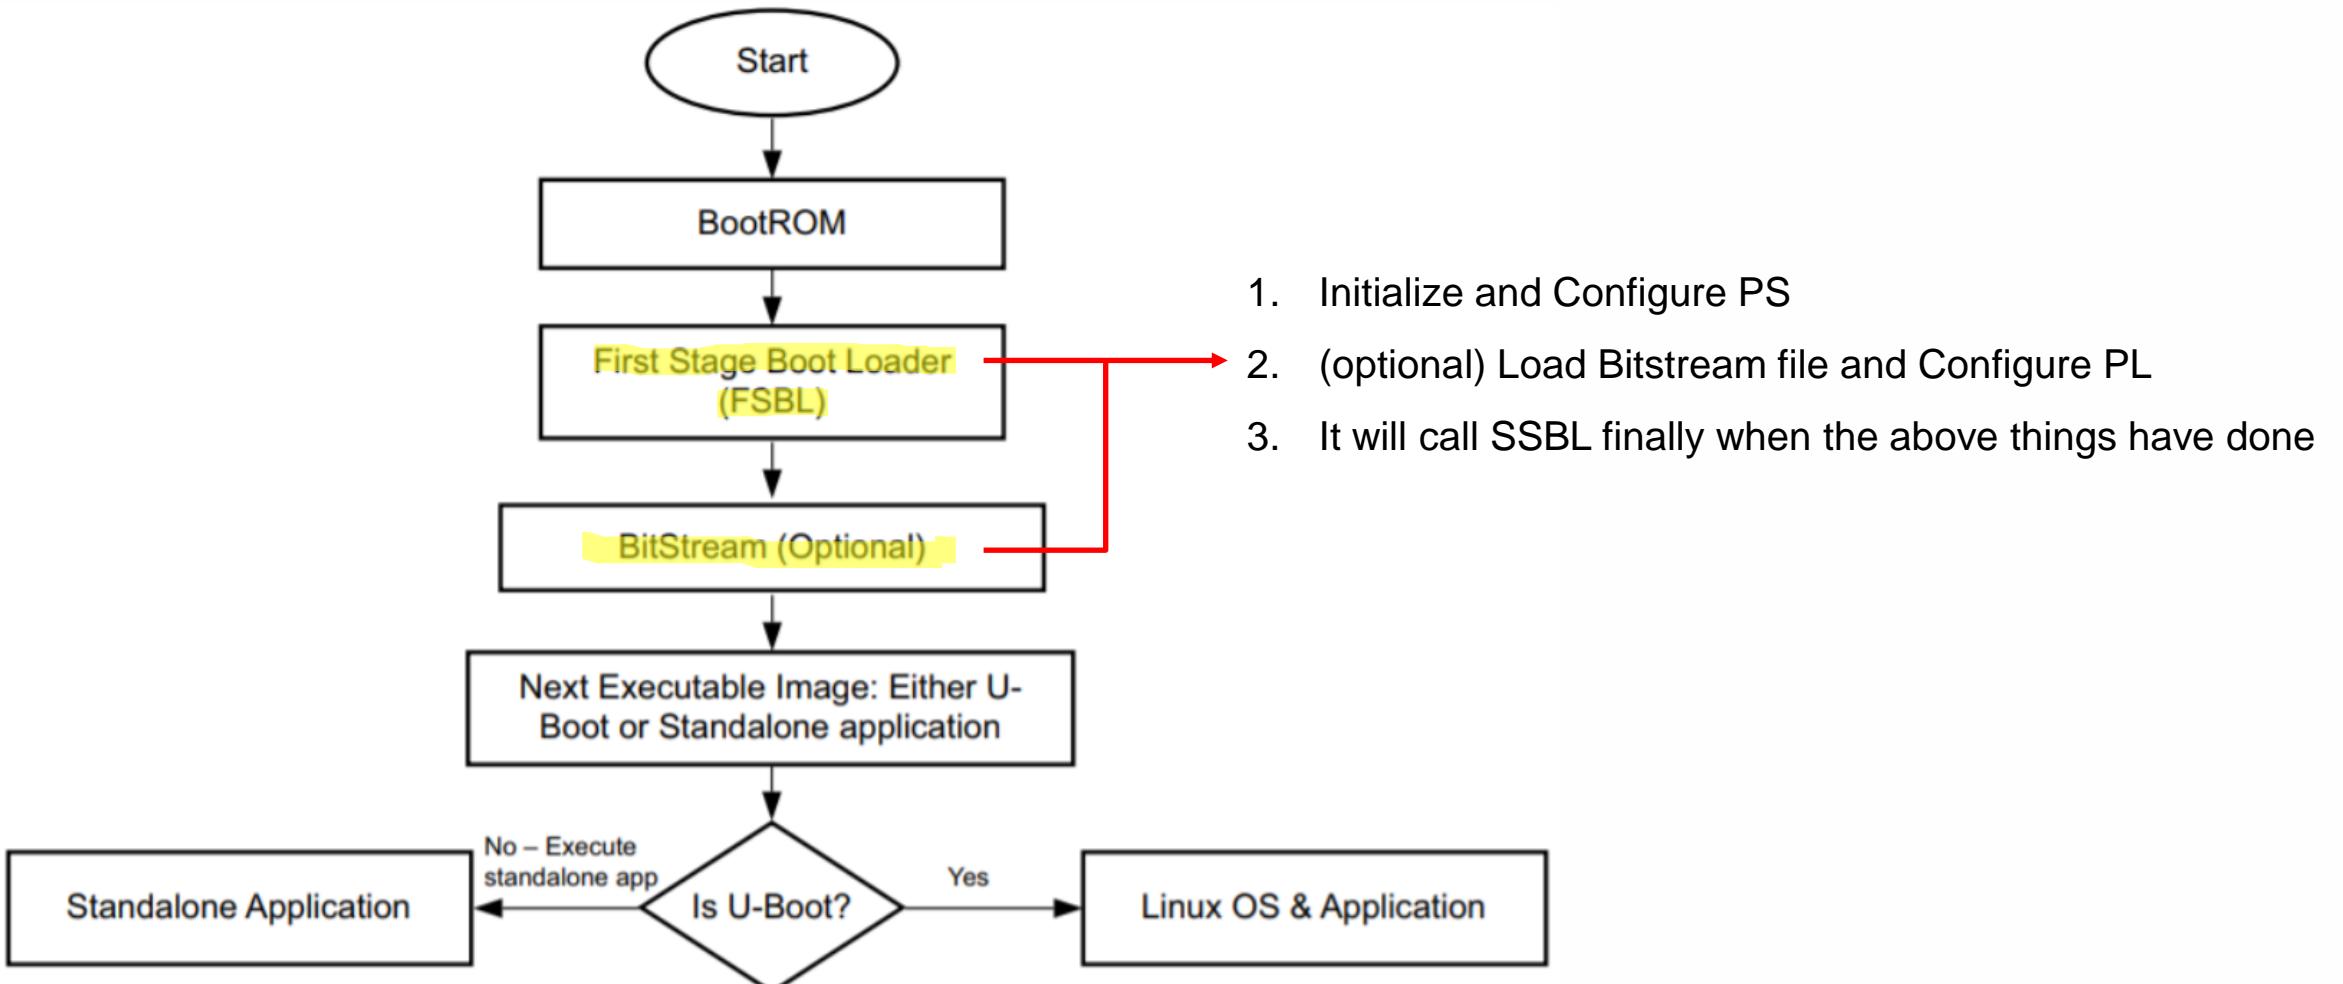

# Zynq Boot and Configuration

## ➤ Multi-stage boot process

- **Stage 0: Runs from ROM; loads from non-volatile memory to OCM**
  - Provided by Xilinx; unmodifiable
- **Stage 1: Runs from OCM; loads from non-volatile memory to DDR memory**
  - User developed; Xilinx offers example code through SDK project
  - Initiates PS boot and PL configuration
- **Stage 2: Optional; runs from DDR**
  - User developed; Xilinx offers example code – U-boot
  - Sourced from flash memory or through common peripherals, programmable logic I/O, etc.
- Programmable logic configuration can be performed in Stage 1 or 2

# Zynq Boot and Configuration

- Multi-stage boot process

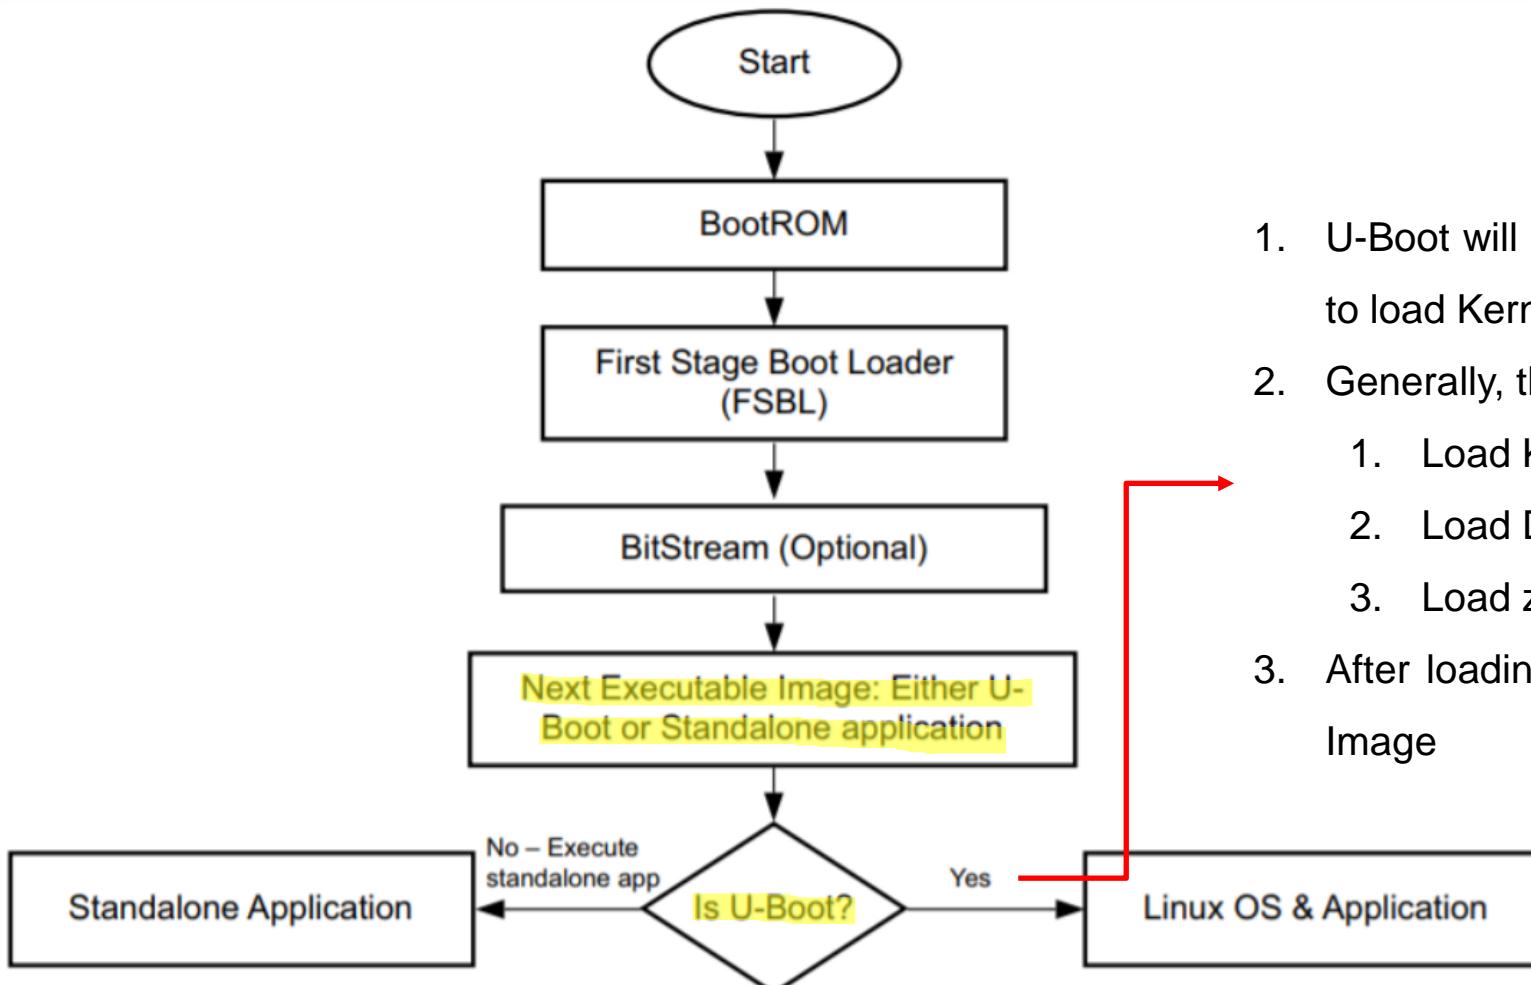

# Zynq Boot and Configuration

- Multi-stage boot process
  - **Stage 0: Runs from ROM; loads from non-volatile memory to OCM**
    - Provided by Xilinx; unmodifiable
  - **Stage 1: Runs from OCM; loads from non-volatile memory to DDR memory**
    - User developed; Xilinx offers example code through SDK project
    - Initiates PS boot and PL configuration
  - **Stage 2: Optional; runs from DDR**
    - User developed; Xilinx offers example code – U-boot
    - Sourced from flash memory or through common peripherals, programmable logic I/O, etc.
  - Programmable logic configuration can be performed in Stage 1 or 2

# Zynq Boot and Configuration

- Multi-stage boot process

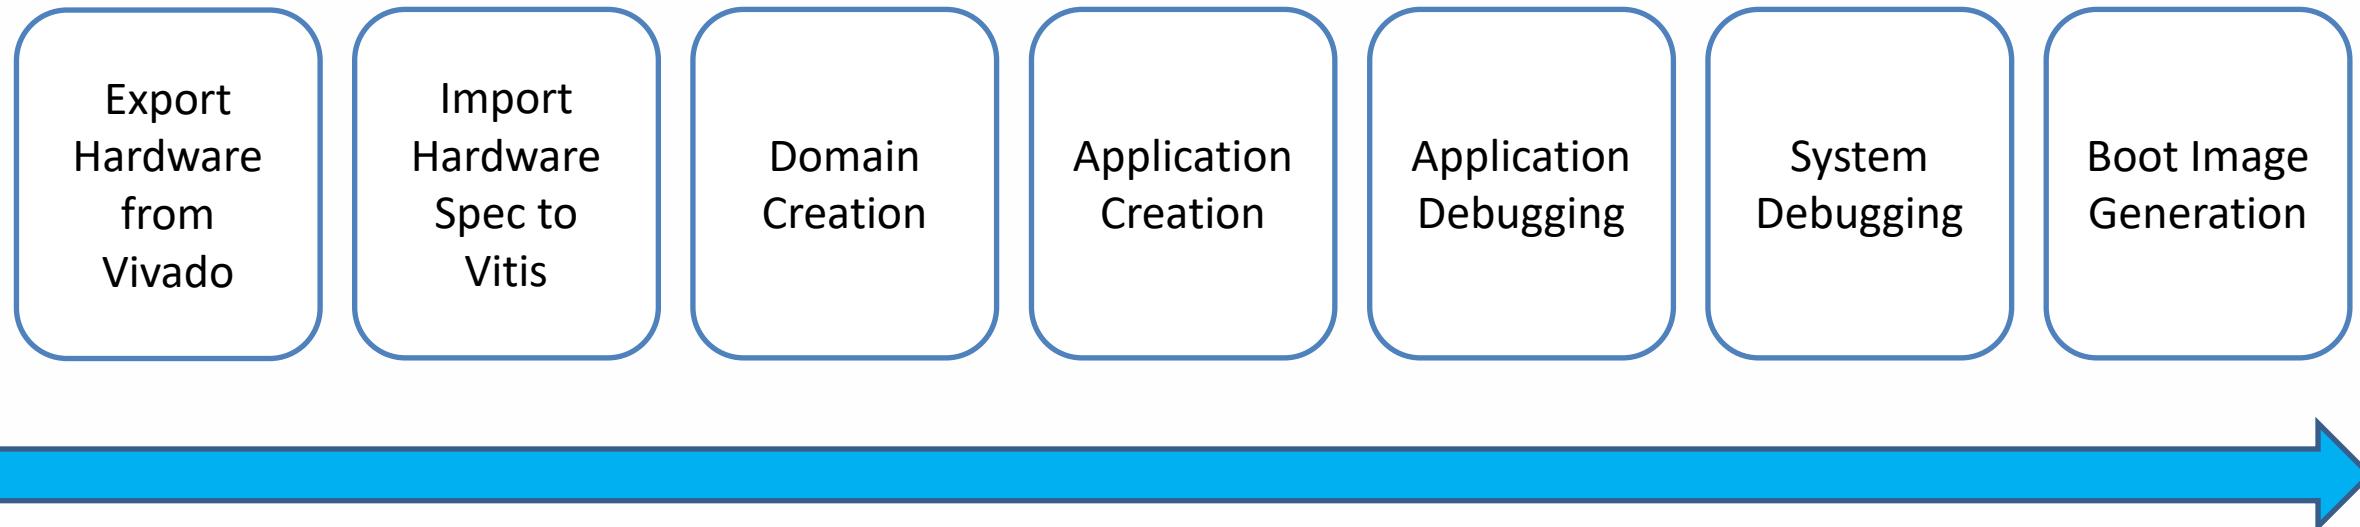

1. U-Boot will execute autoboot code and check BootMode Pins to load Kernel Image from where
2. Generally, the loading step includes:
  1. Load Kernel Image from SD Card and copy it to DDR
  2. Load DTB File (devicetree.dtb)
  3. Load zipped ramdisk file system
3. After loading completing, U-Boot will start to execute Kernel Image

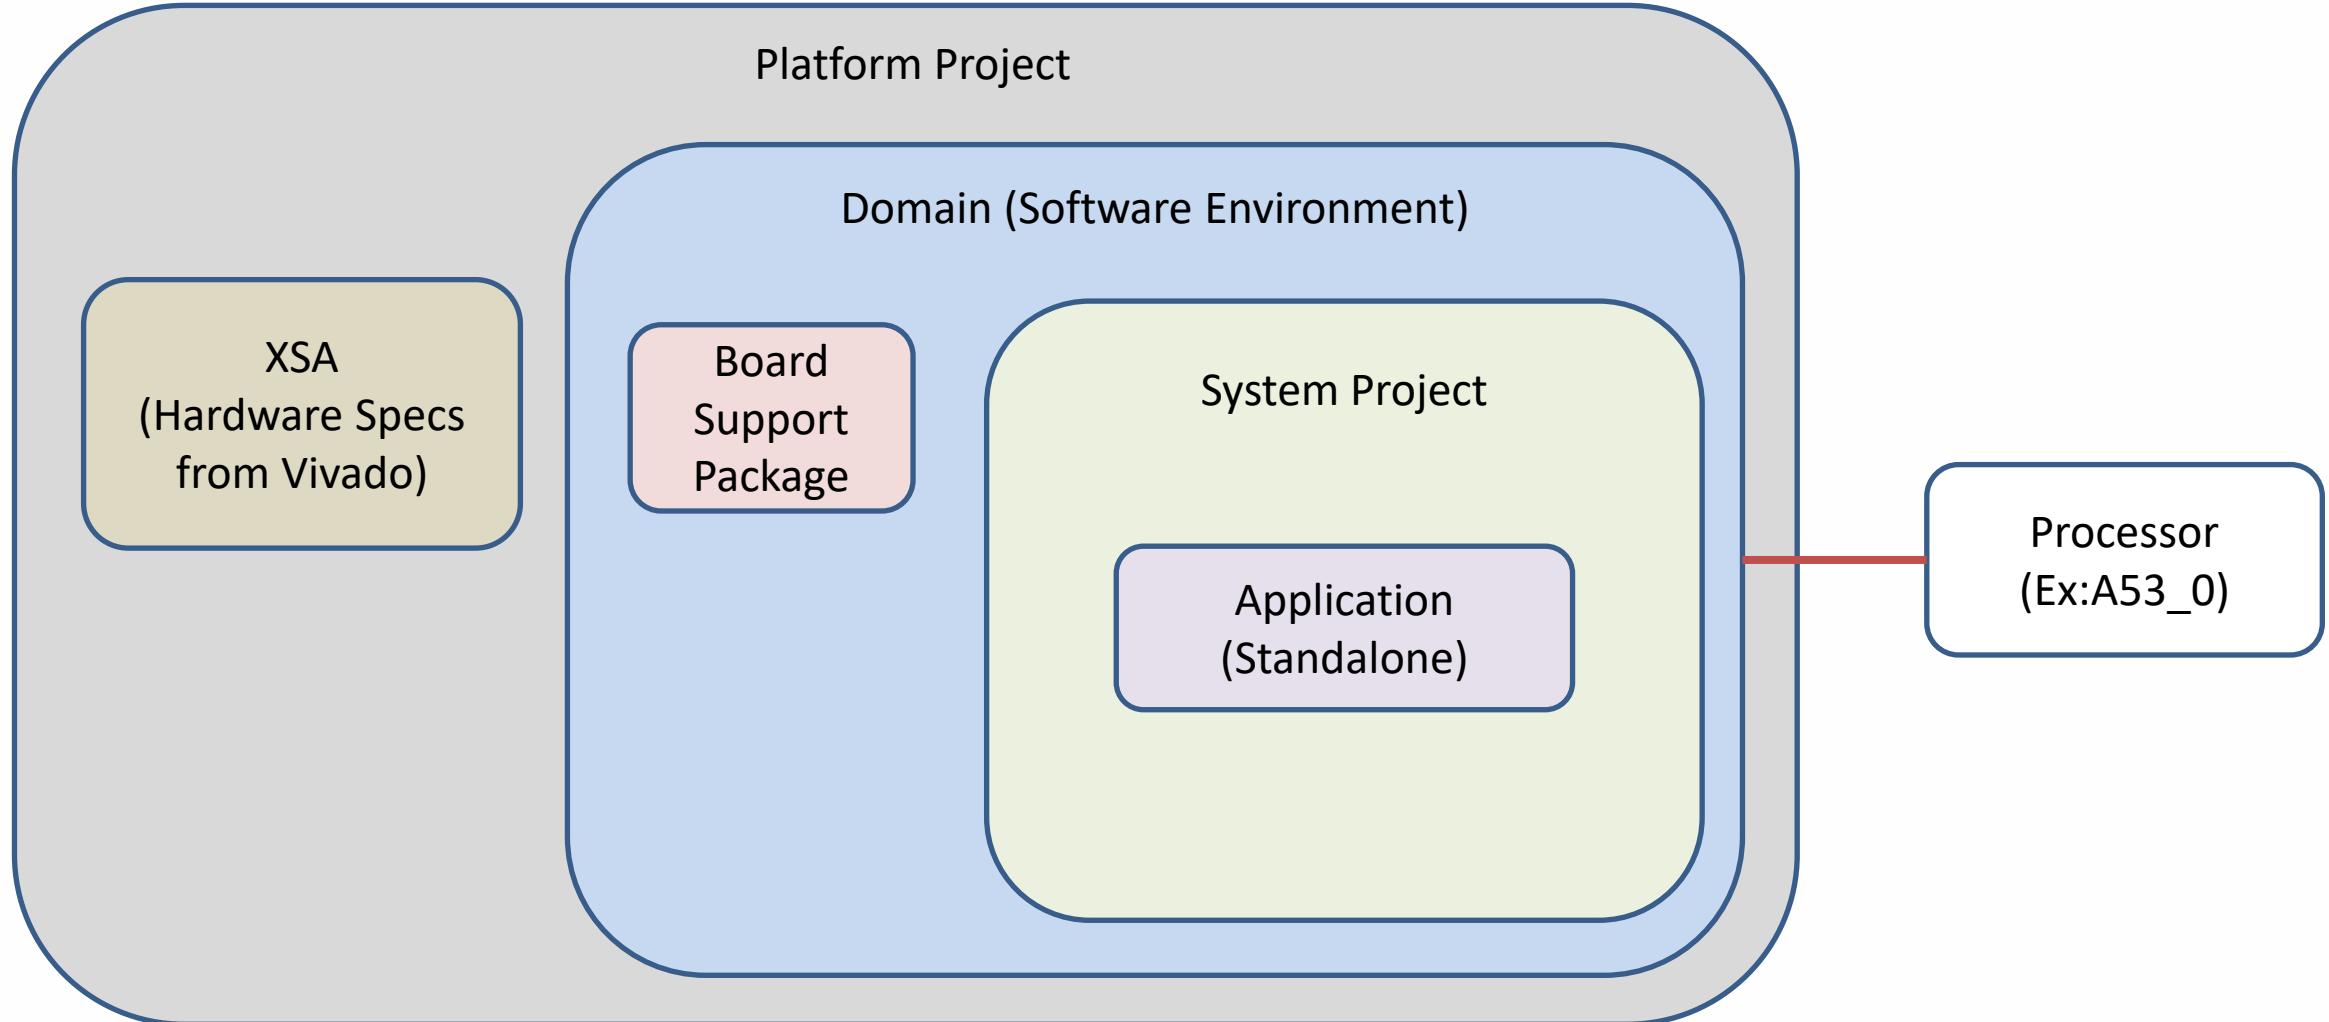

# Vitis Development Workflow

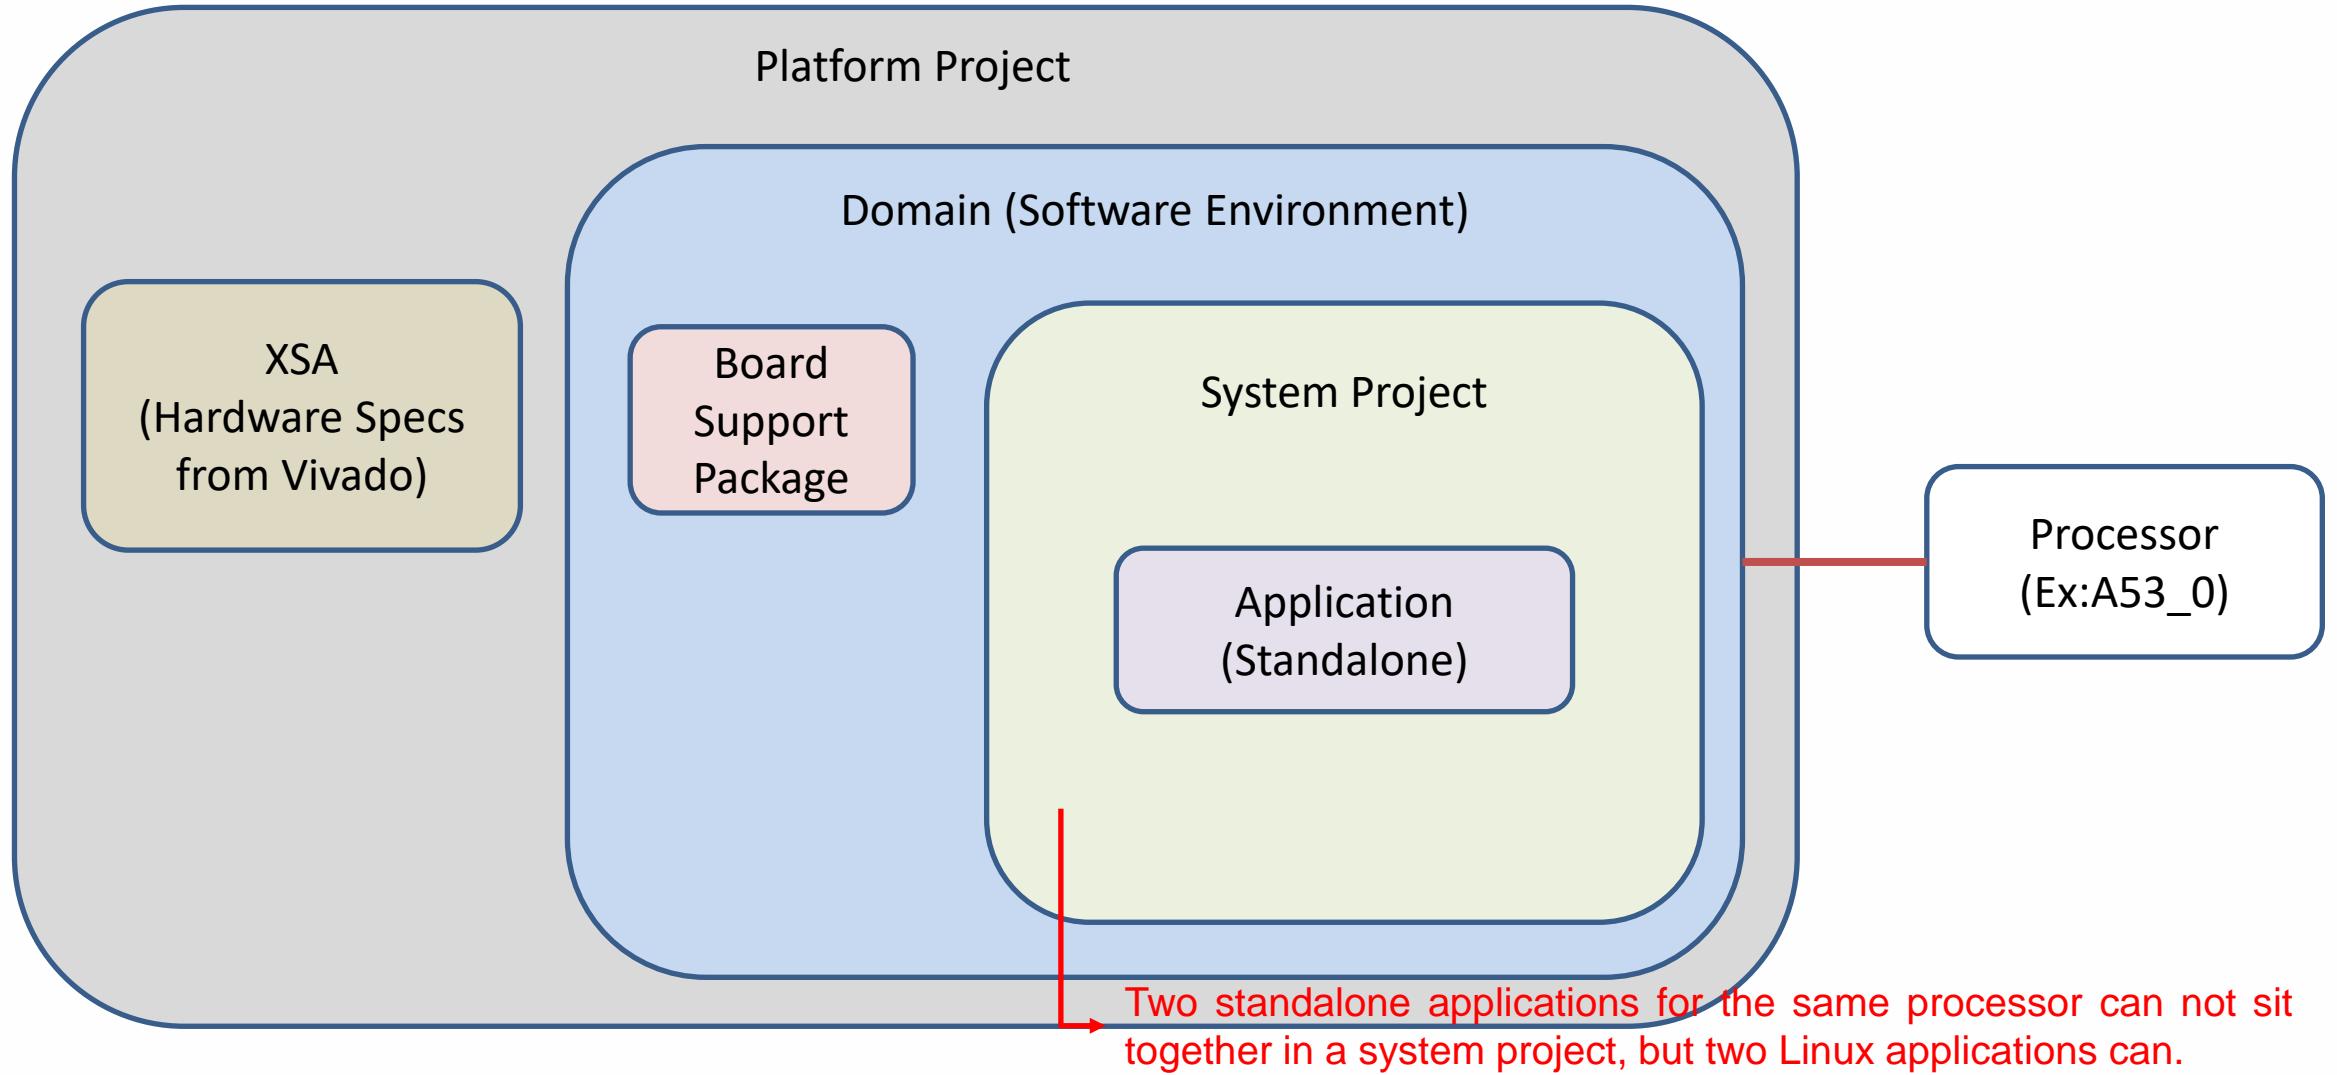

# Vitis Software Development Workflow

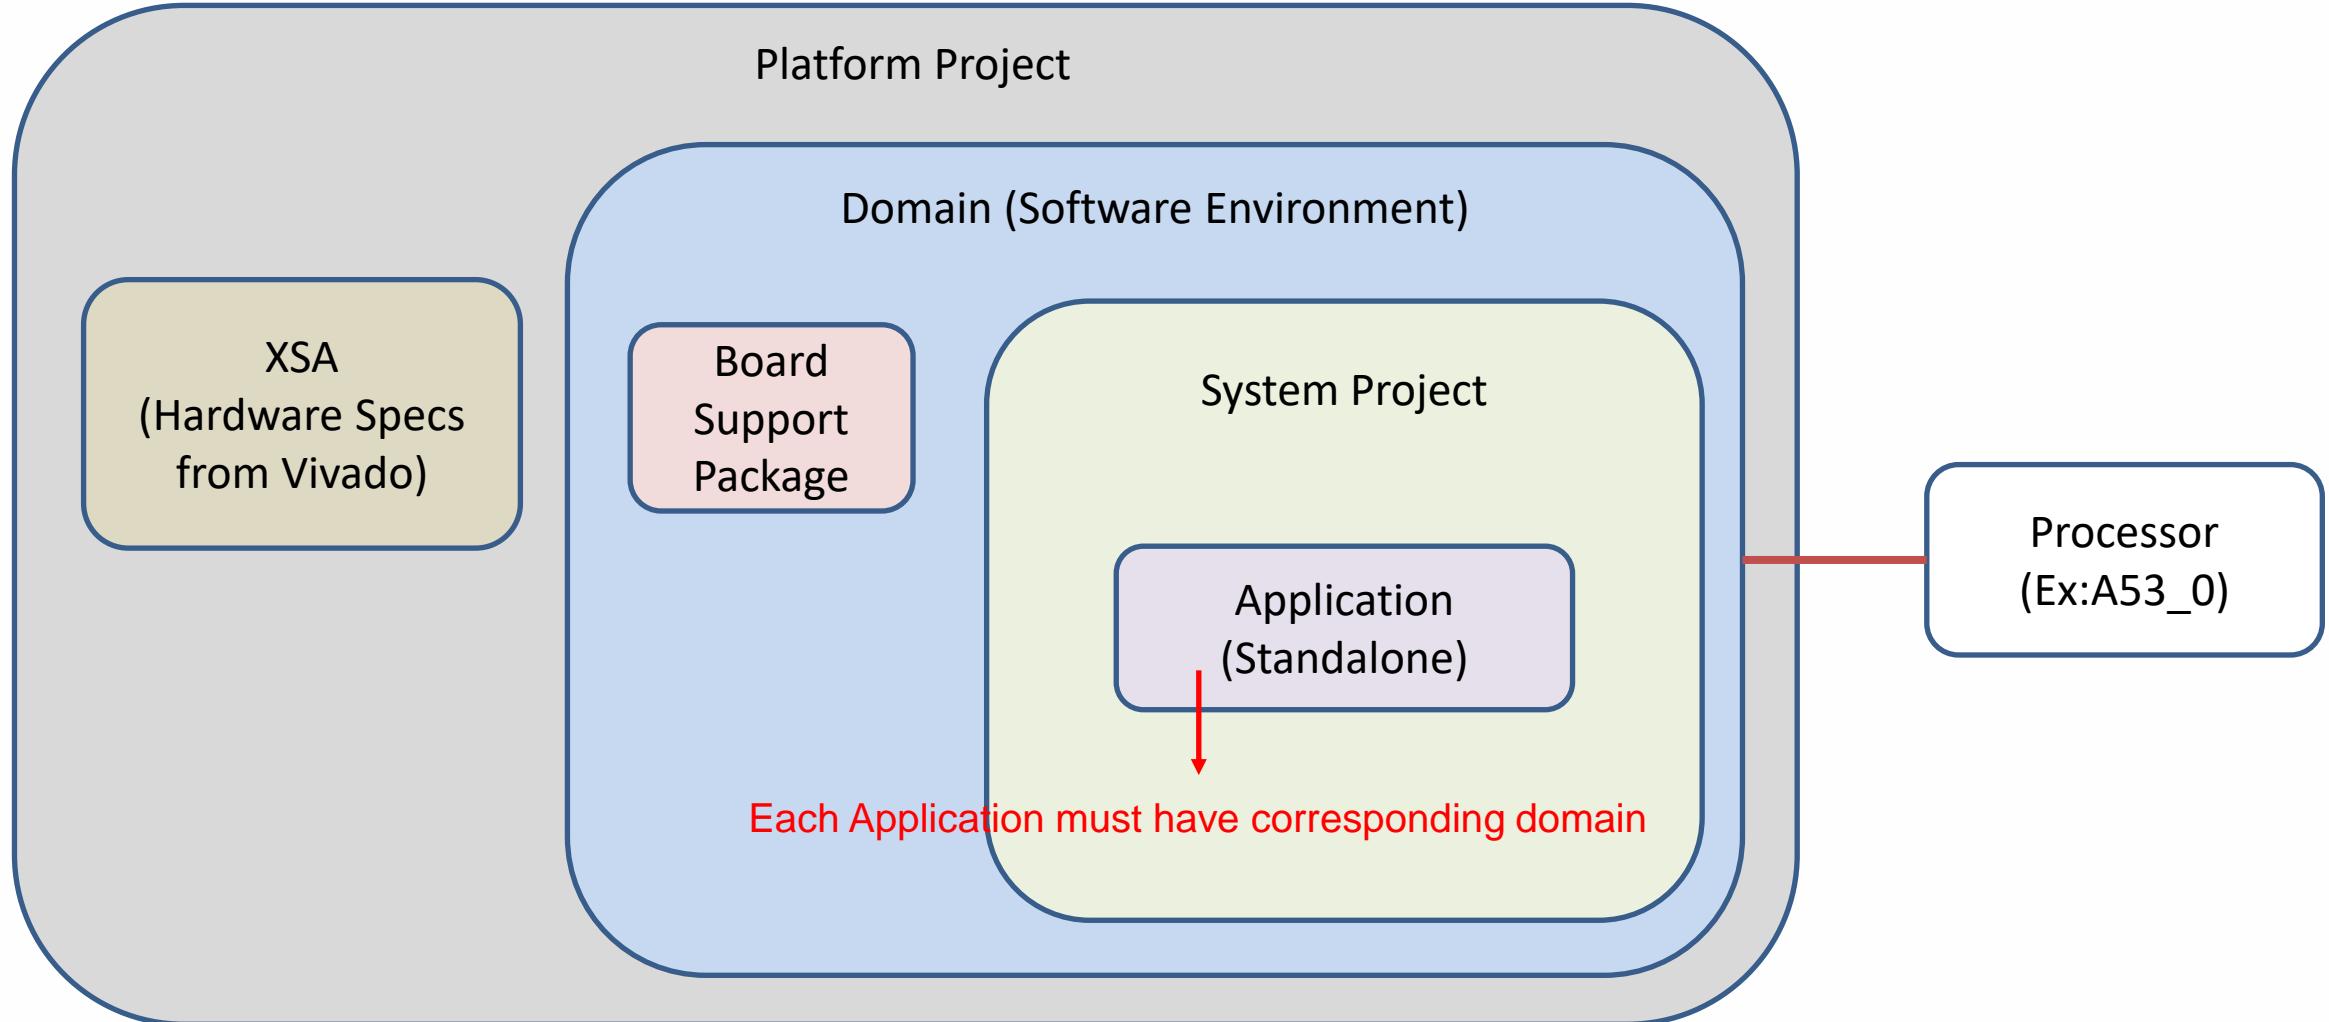

# Vitis Workspace Structure

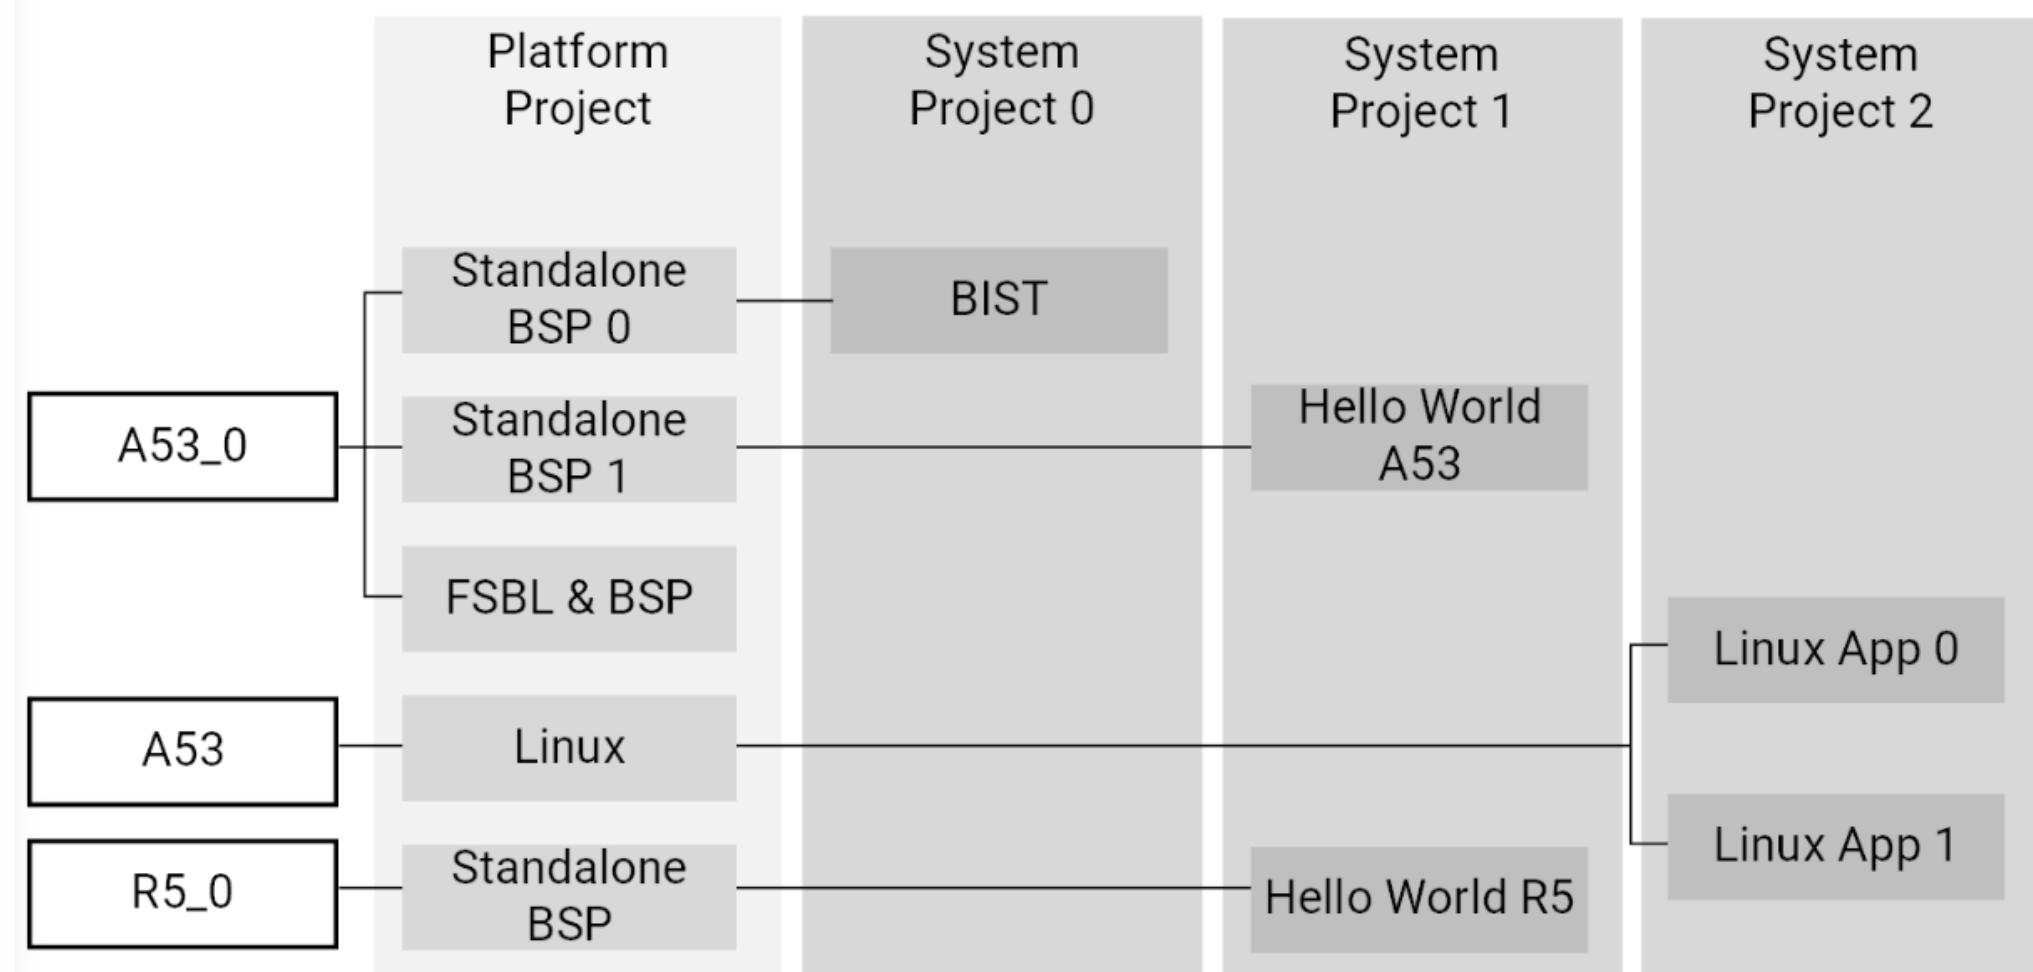

# Vitis Workspace Structure

# Vitis Workspace Structure

# Vitis Workspace Structure

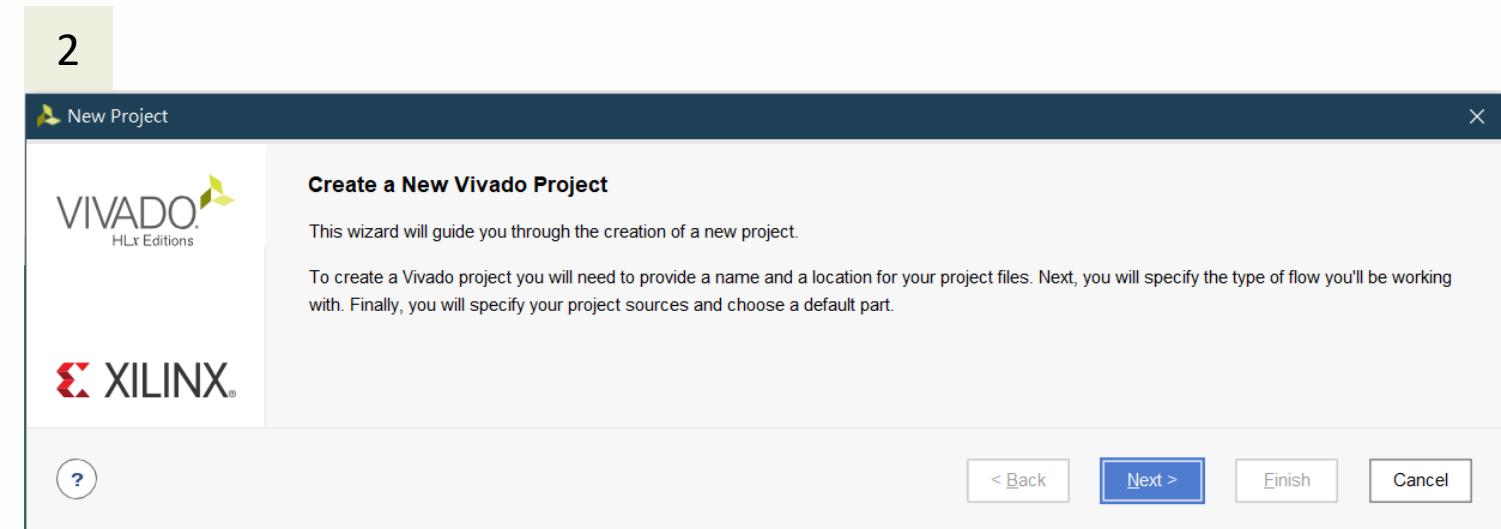

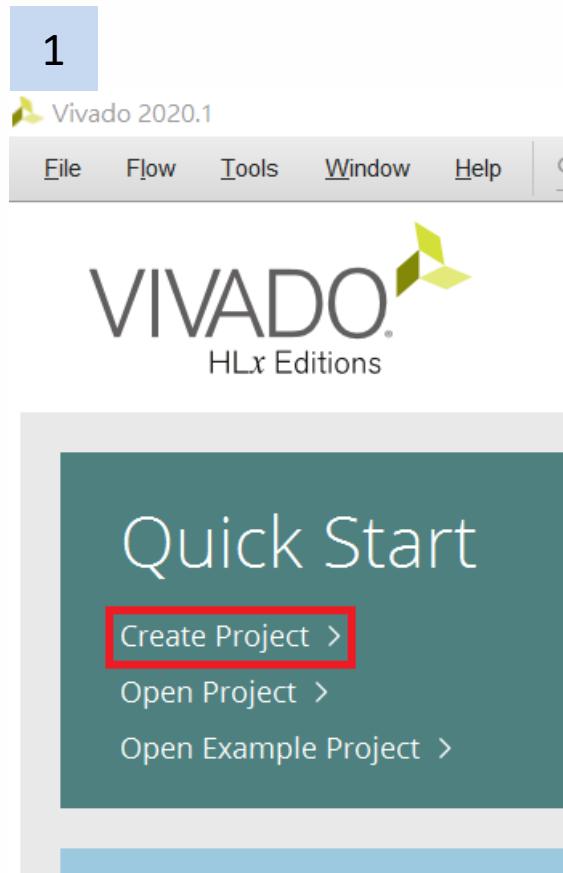

# Preparatory Work from Vivado (XSA Creation)

# Create a Vivado Project

- ◆ This course is meant to build a baremetal application that controls LED effect on a zynq device.
- ◆ Start with creating a vivado project.

# Create a Vivado Project

1

New Project

**Project Name**  
Enter a name for your project and specify a directory where the project data files will be stored.

Project name:  zynq\_led

Project location:  C:/Users/User/Desktop/Vitis/forslides

Create project subdirectory

Project will be created at: C:/Users/User/Desktop/Vitis/forslides

< Back Next > Finish Cancel

2

New Project

**Project Type**  
Specify the type of project to create.

**RTL Project**  
You will be able to add sources, create block designs in IP Integrator, generate IP, run RTL analysis, synthesis, implementation, design planning and analysis.  
 Do not specify sources at this time

**Post-synthesis Project**  
You will be able to add sources, view device resources, run design analysis, planning and implementation.  
 Do not specify sources at this time

**I/O Planning Project**  
Do not specify design sources. You will be able to view part/package resources.

**Imported Project**  
Create a Vivado project from a Synplify, XST or ISE Project File.

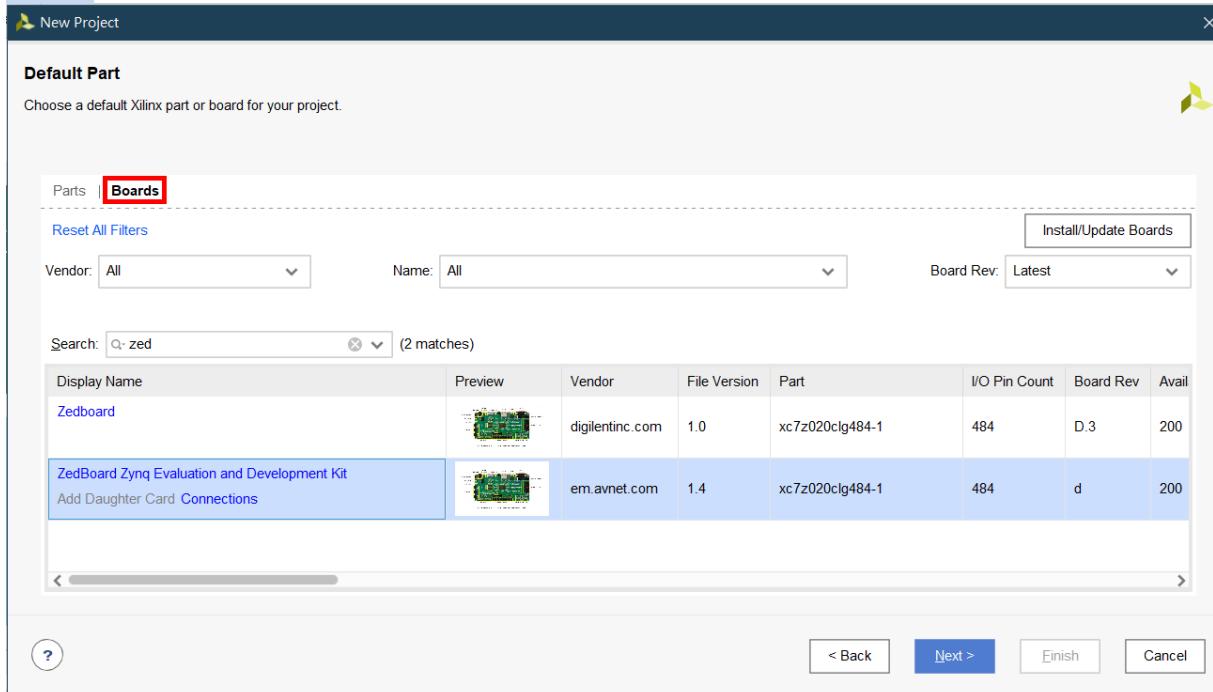

**Example Project**  
Create a new Vivado project from a predefined template.

< Back Next > Finish Cancel

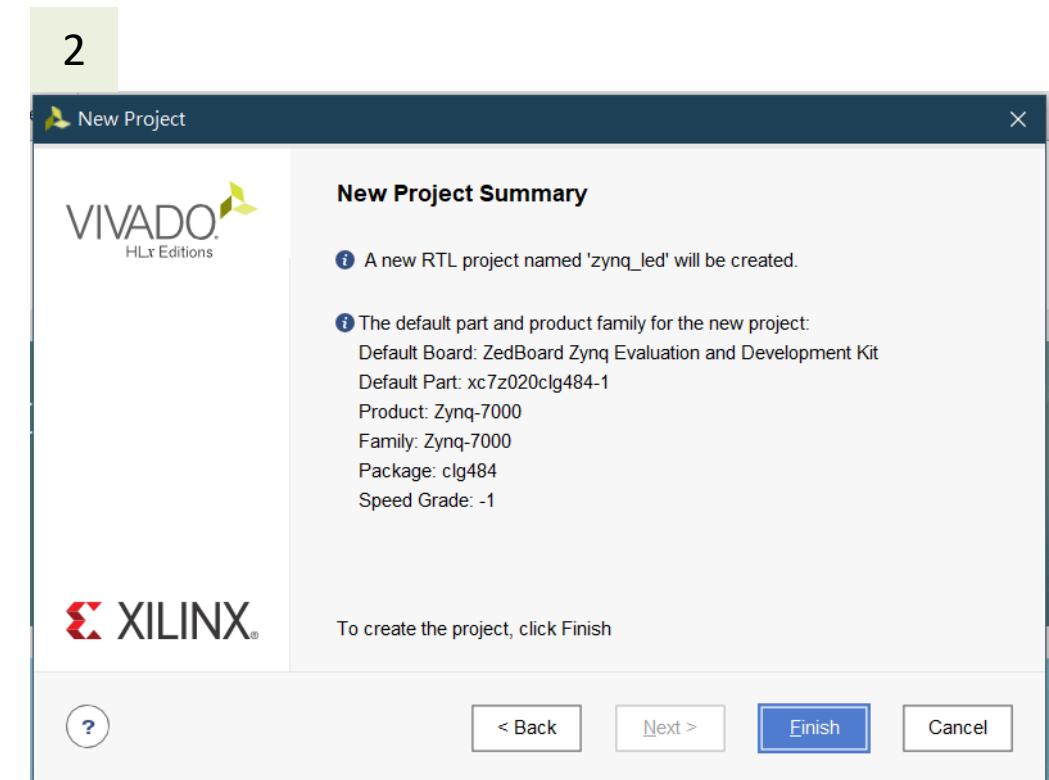

# Create a Vivado Project

- ◆ In this step, it is vital to select the corresponding device. Vivado generates xsa file based on the device selected here.

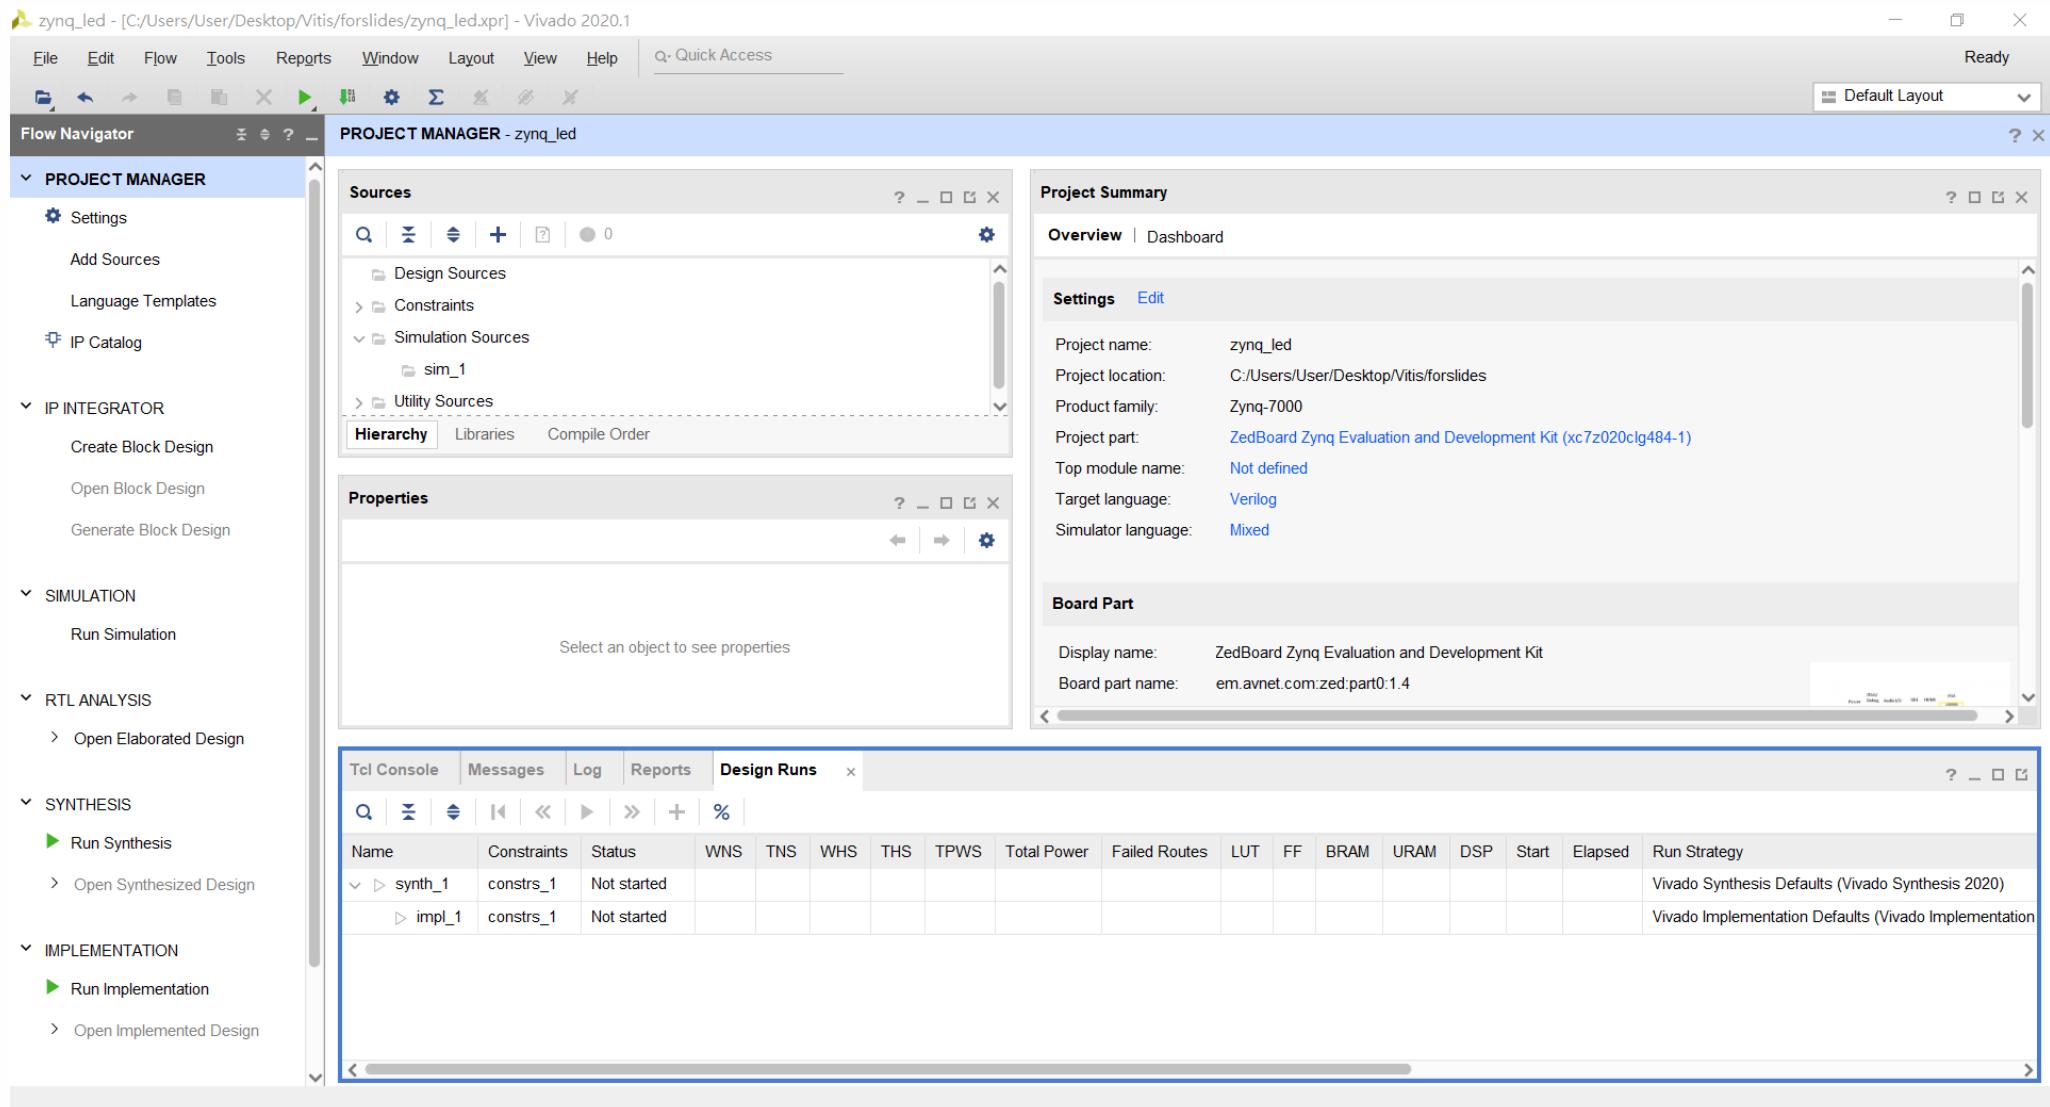

1

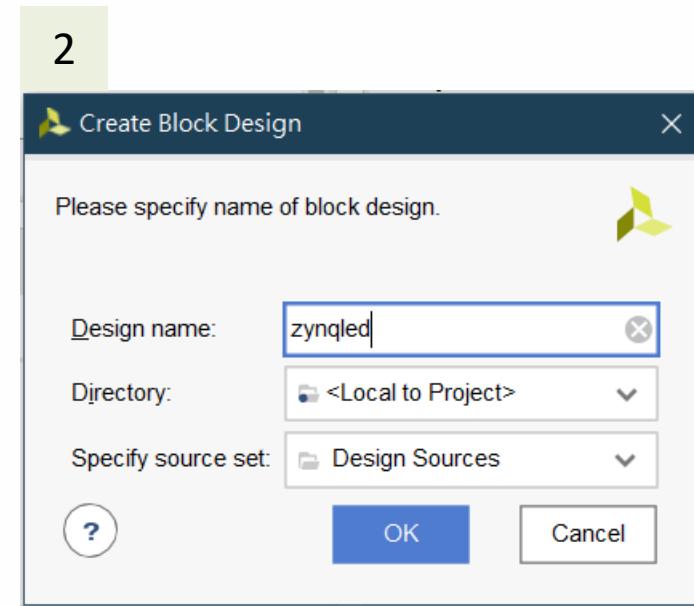

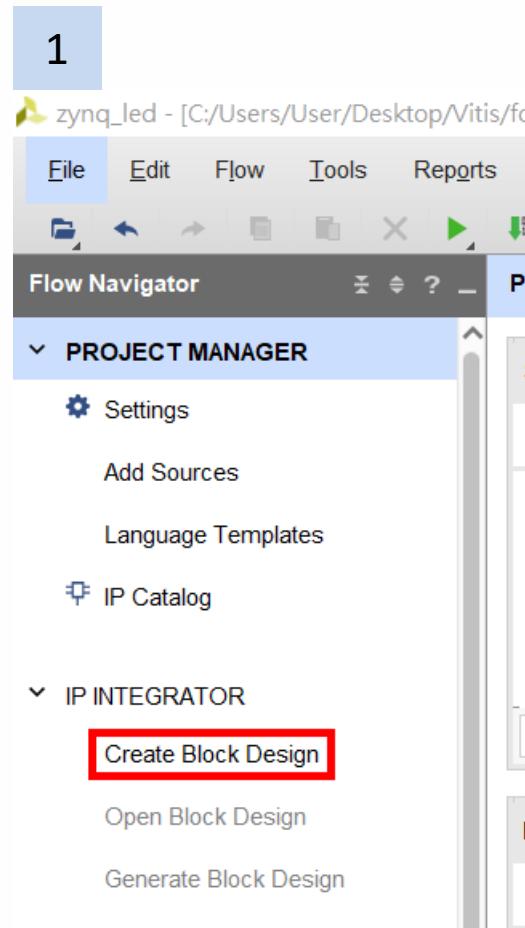

2

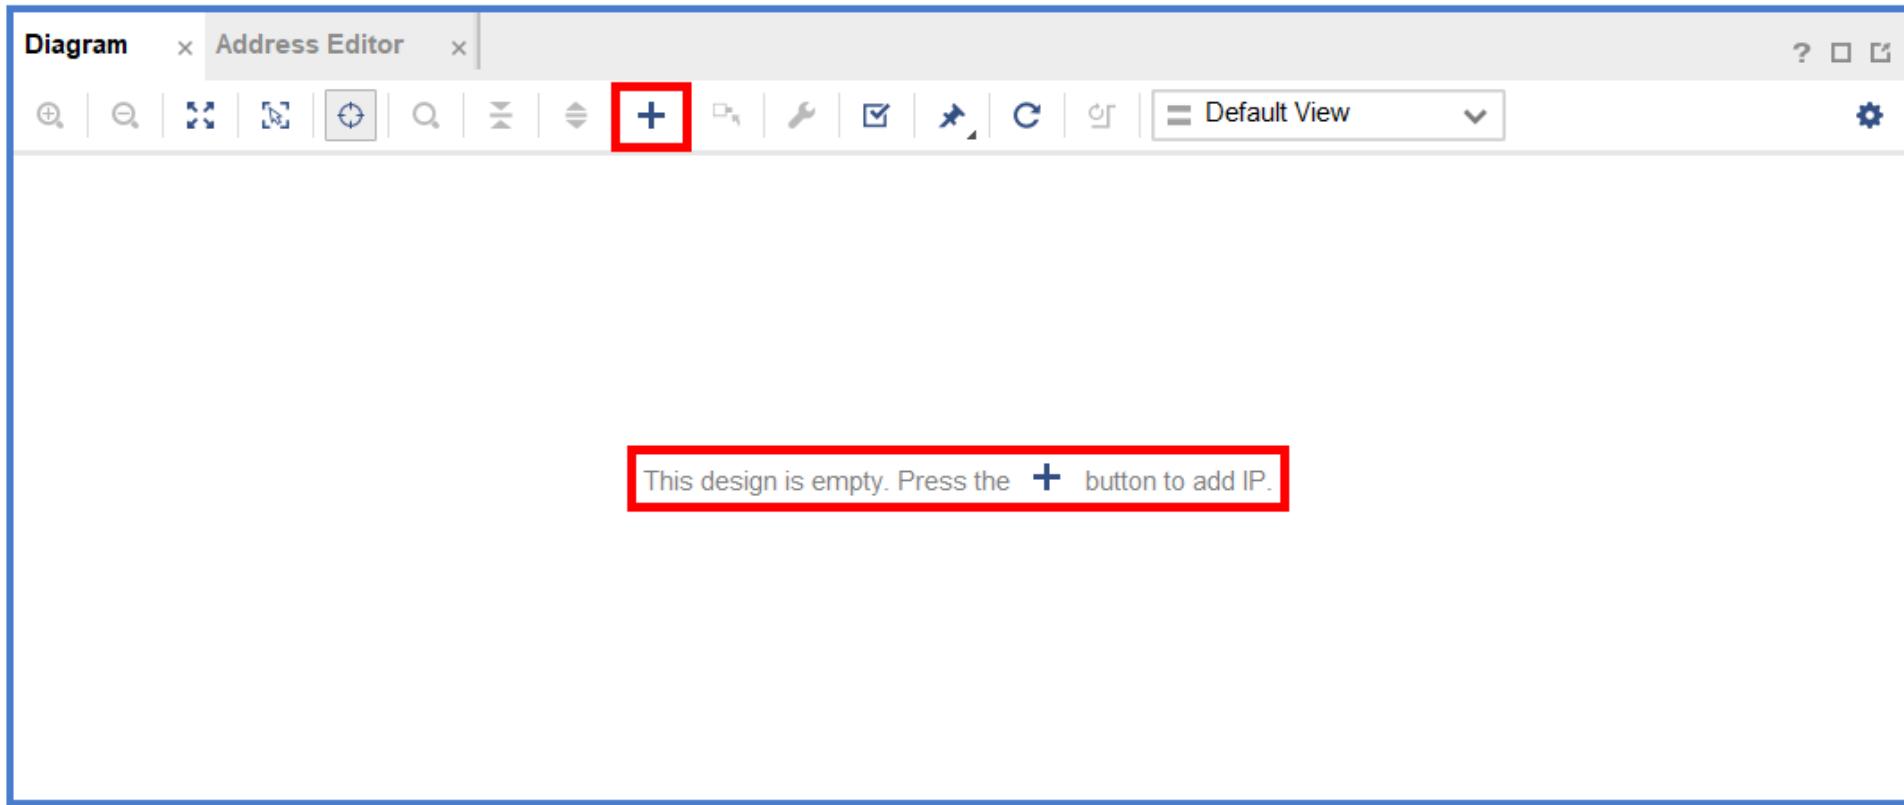

# Vivado

# Create a block design

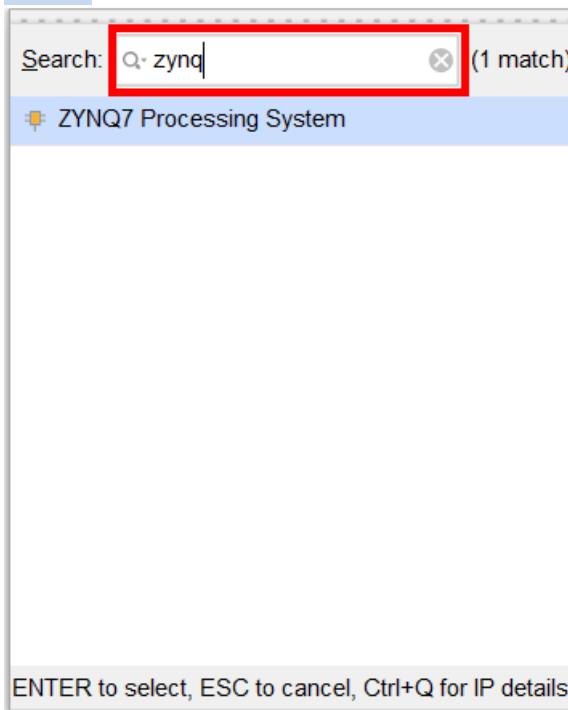

# Add IP

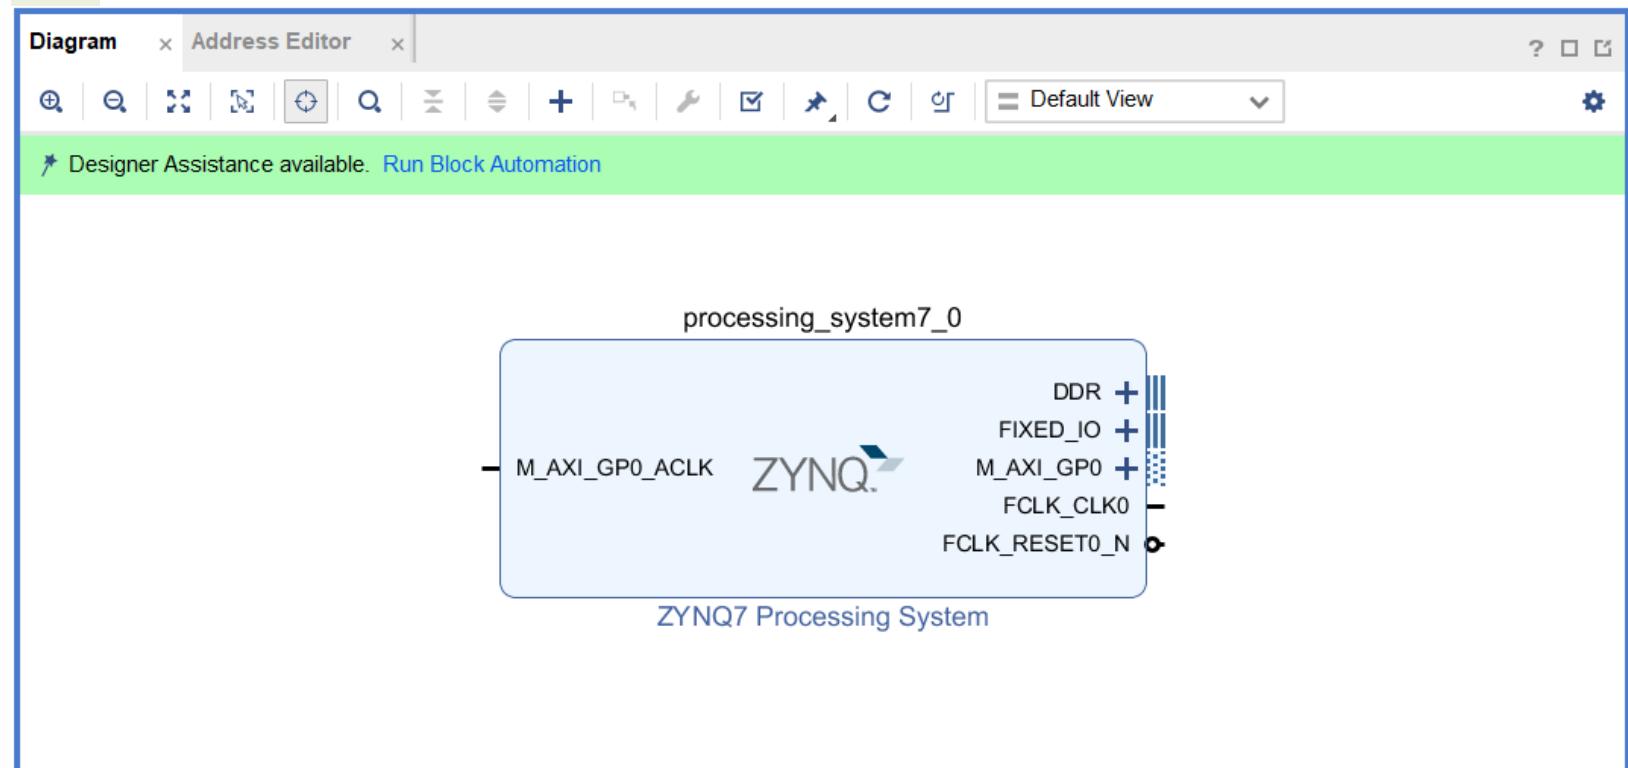

# Add Zynq-7000 IP

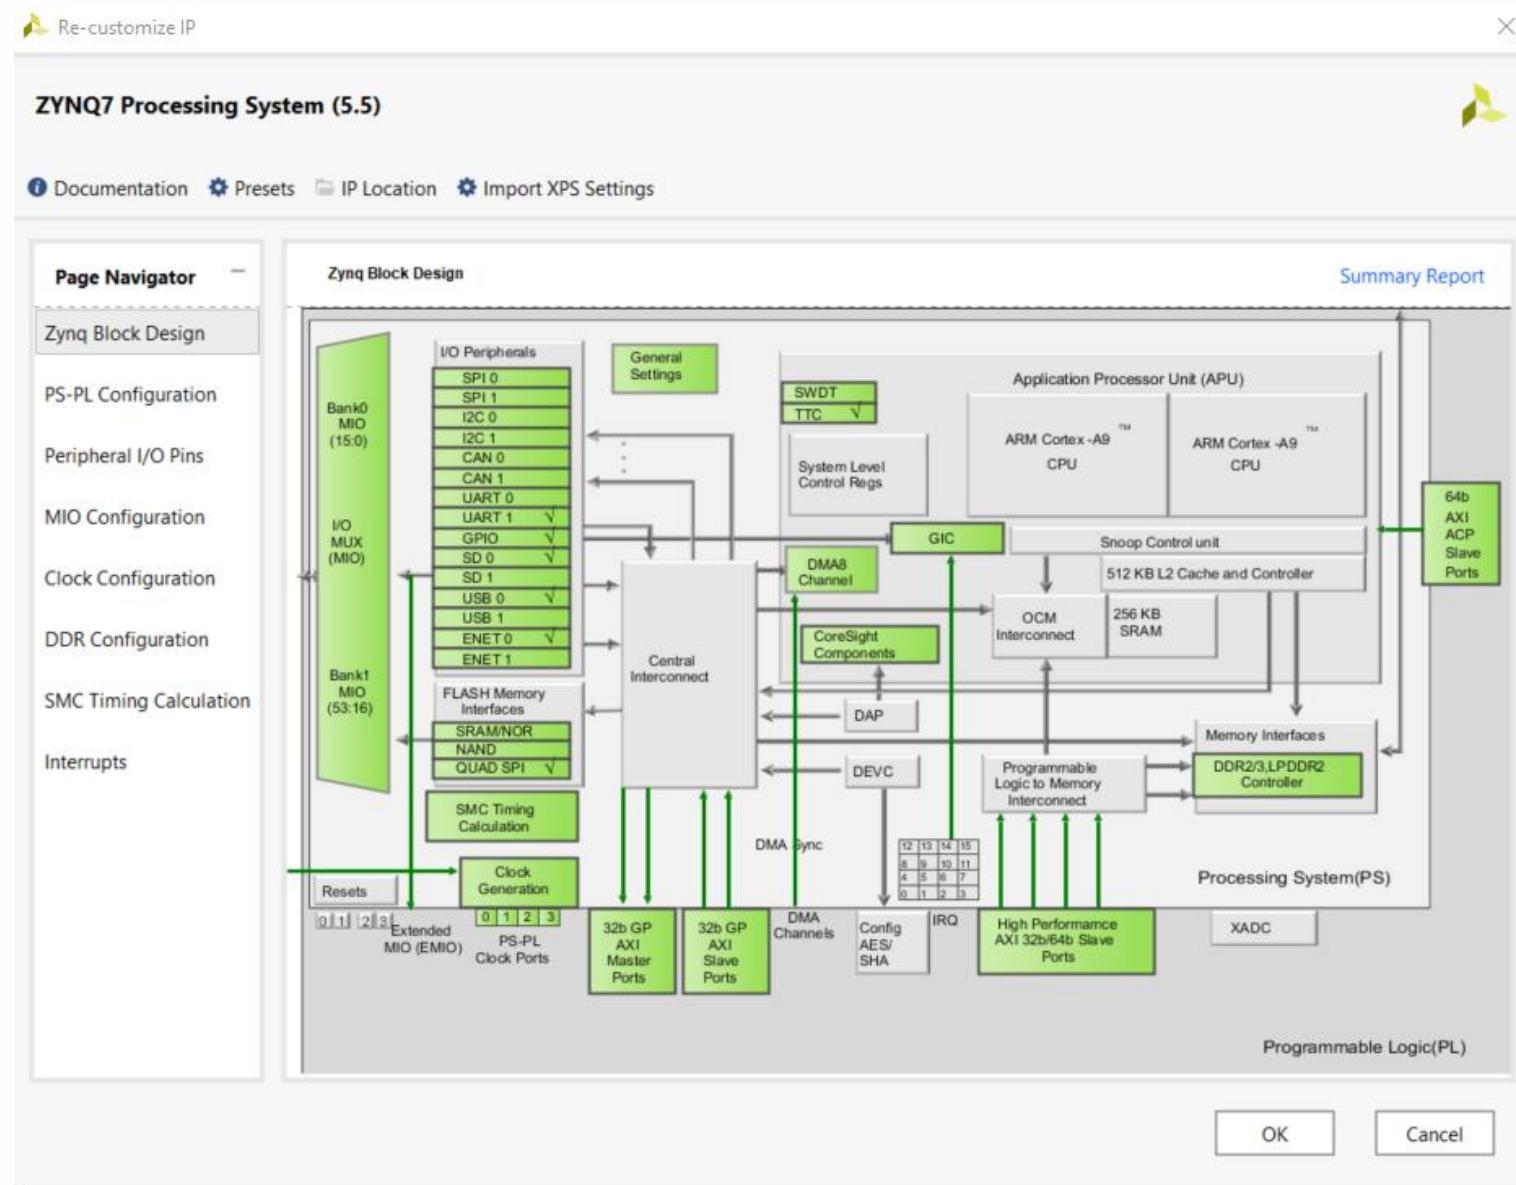

1

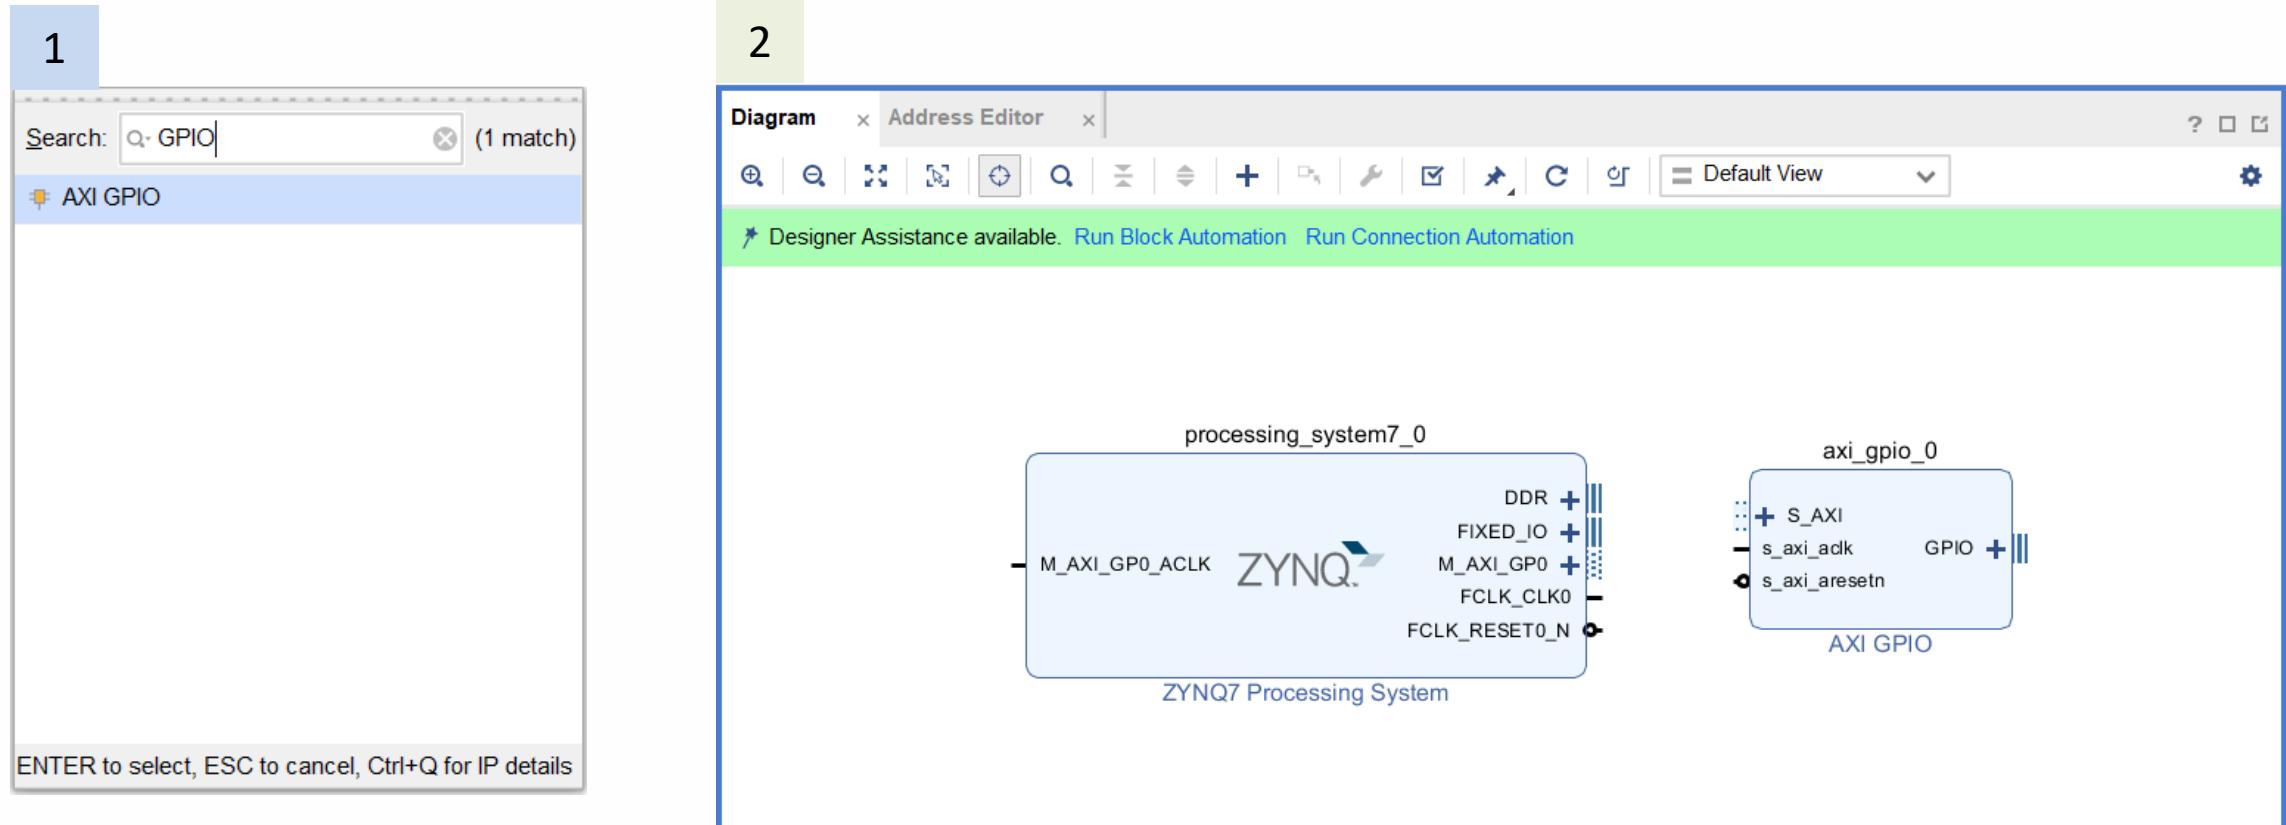

2

# Add Zynq-7000 IP

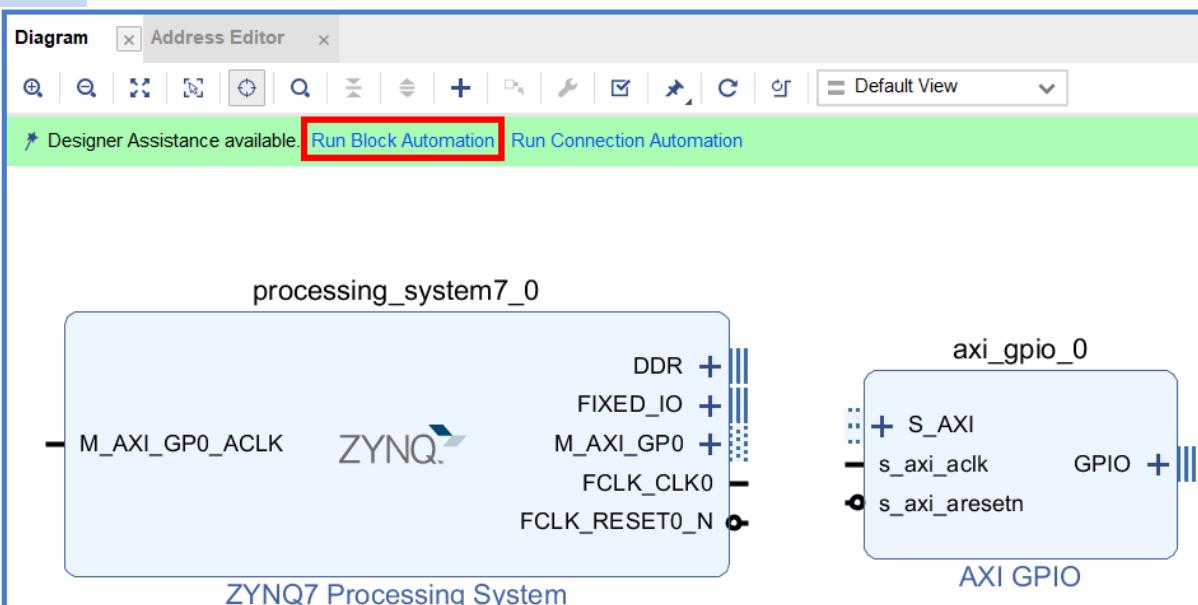

# Add AXI GPIO IP

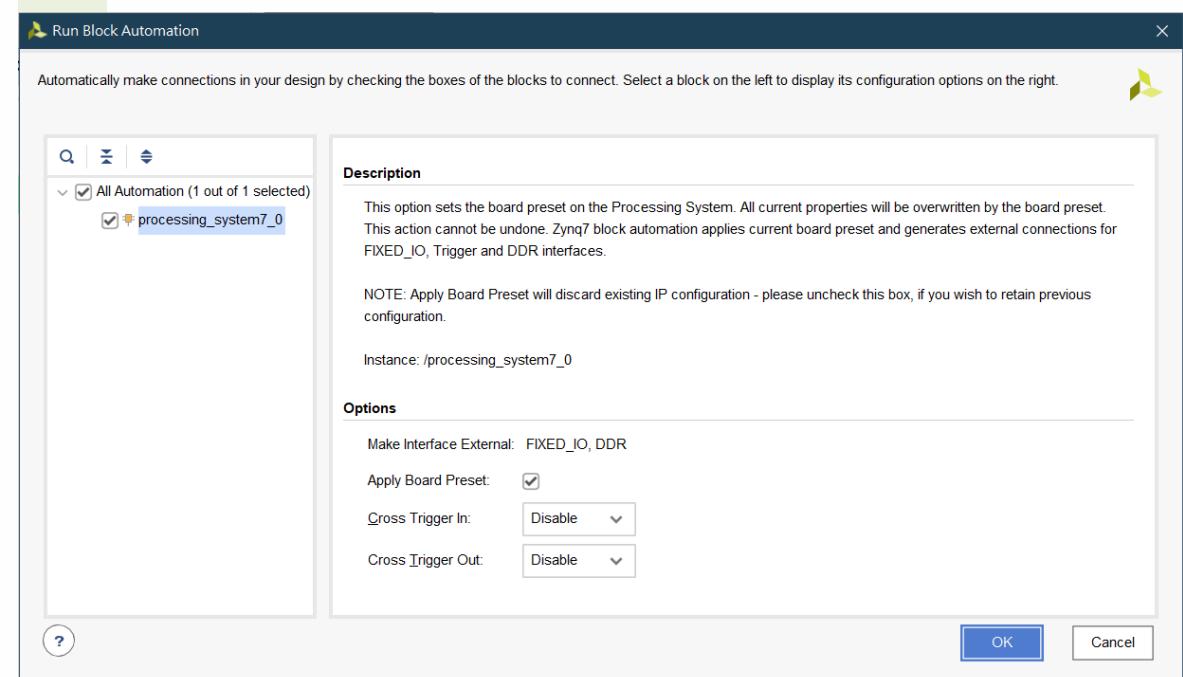

# Block Automation

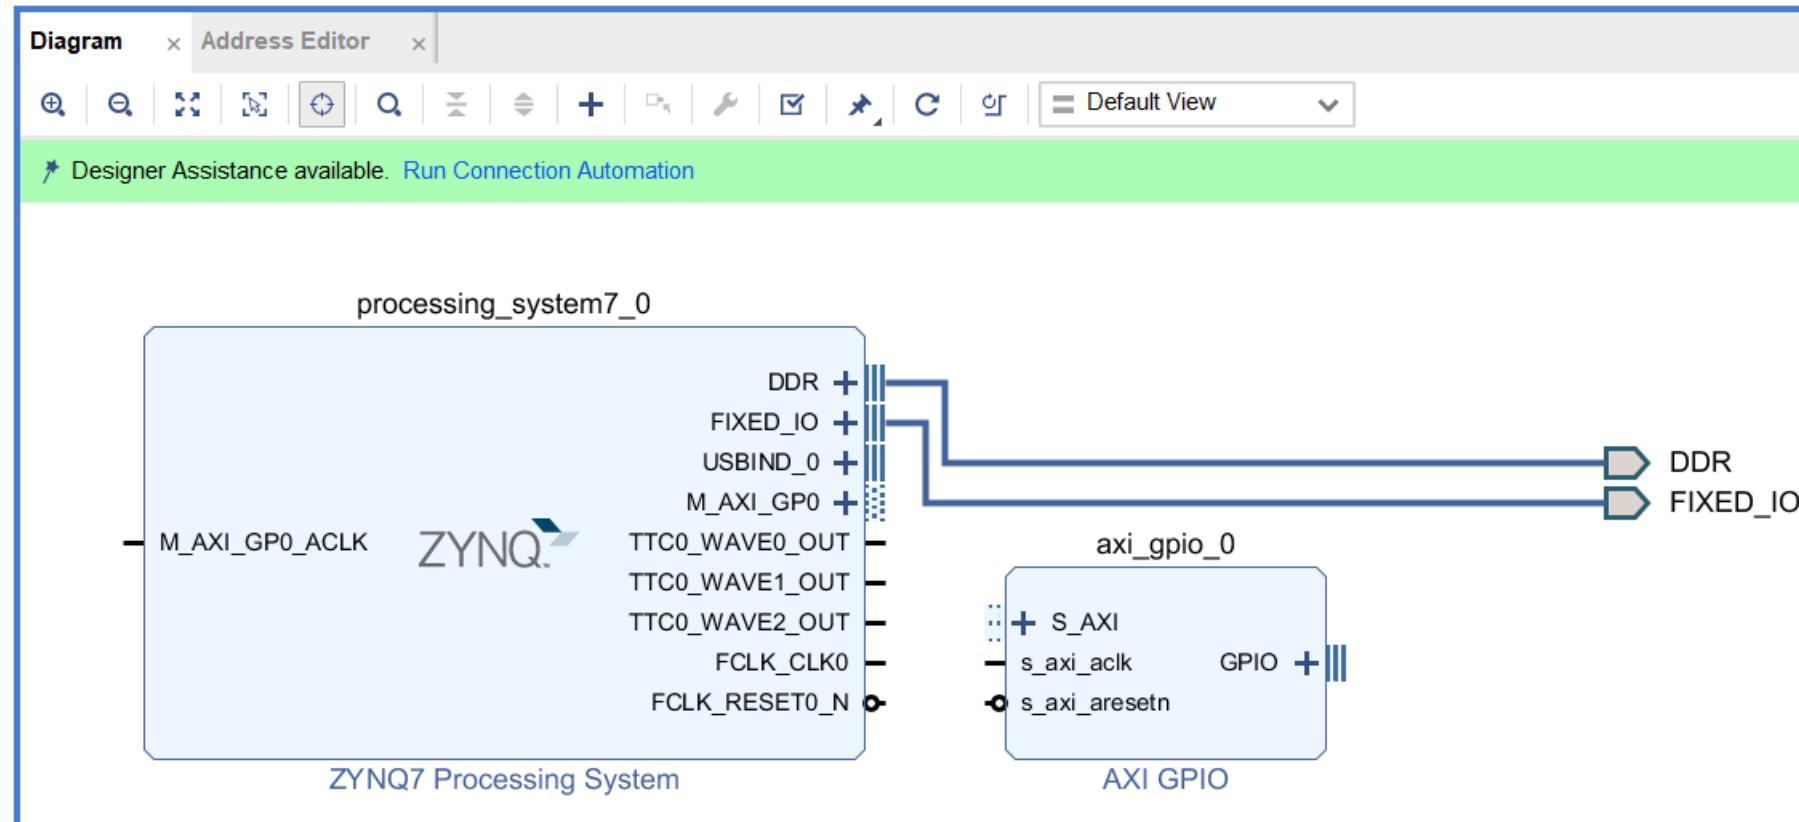

1

2

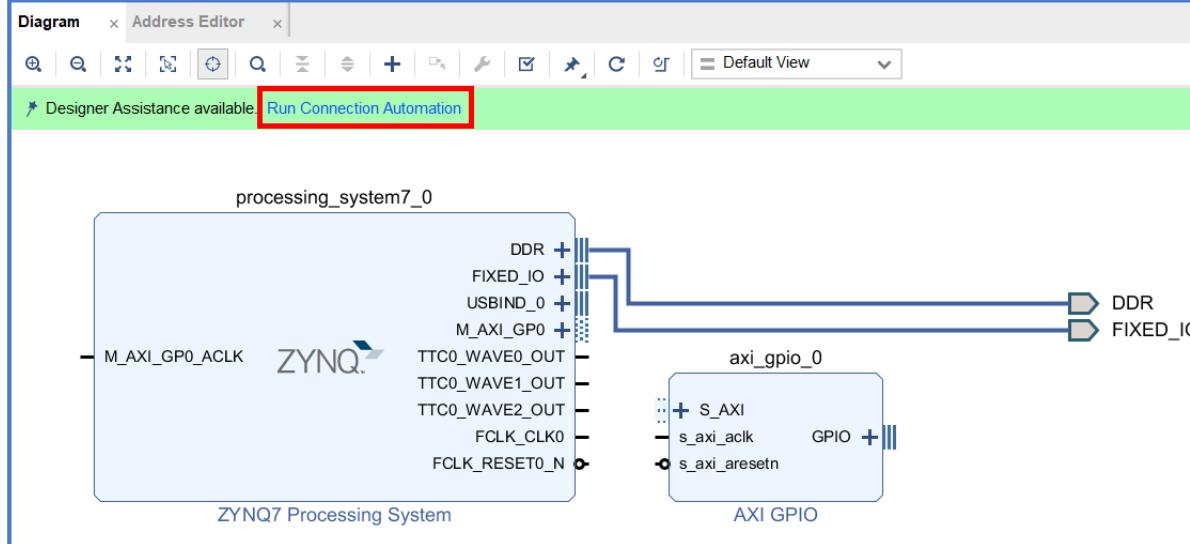

# Block Automation

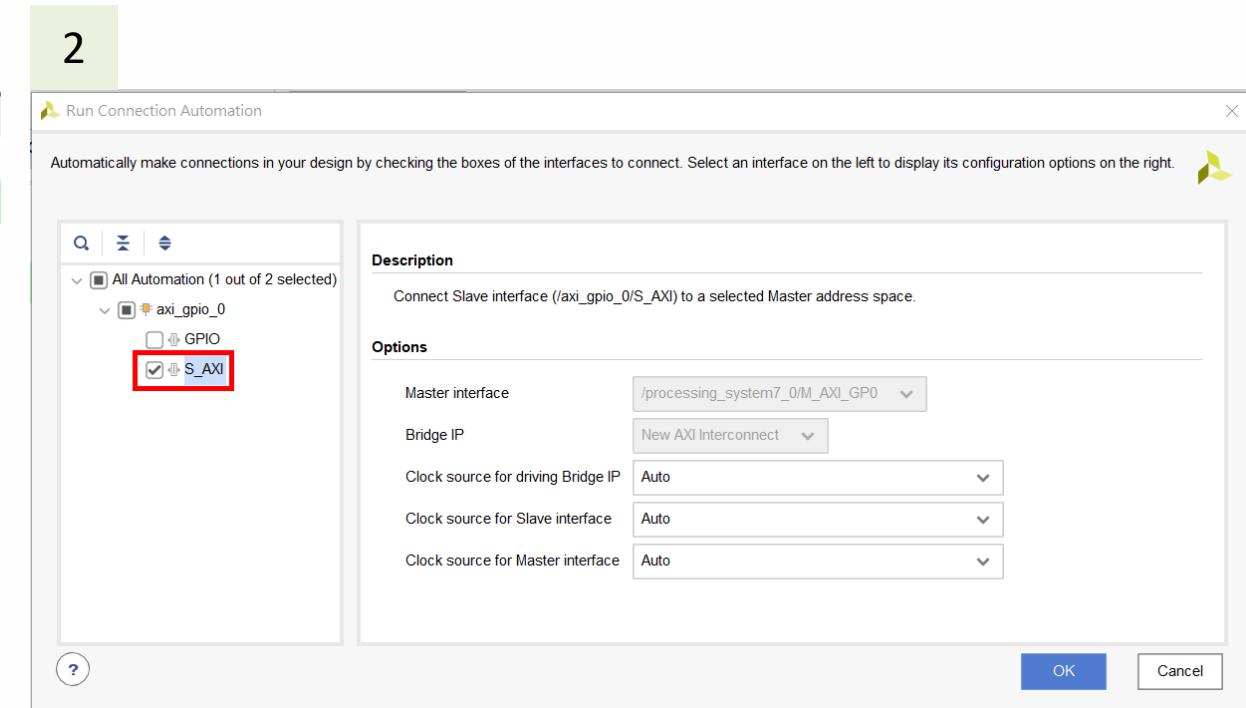

# Connection automation

1

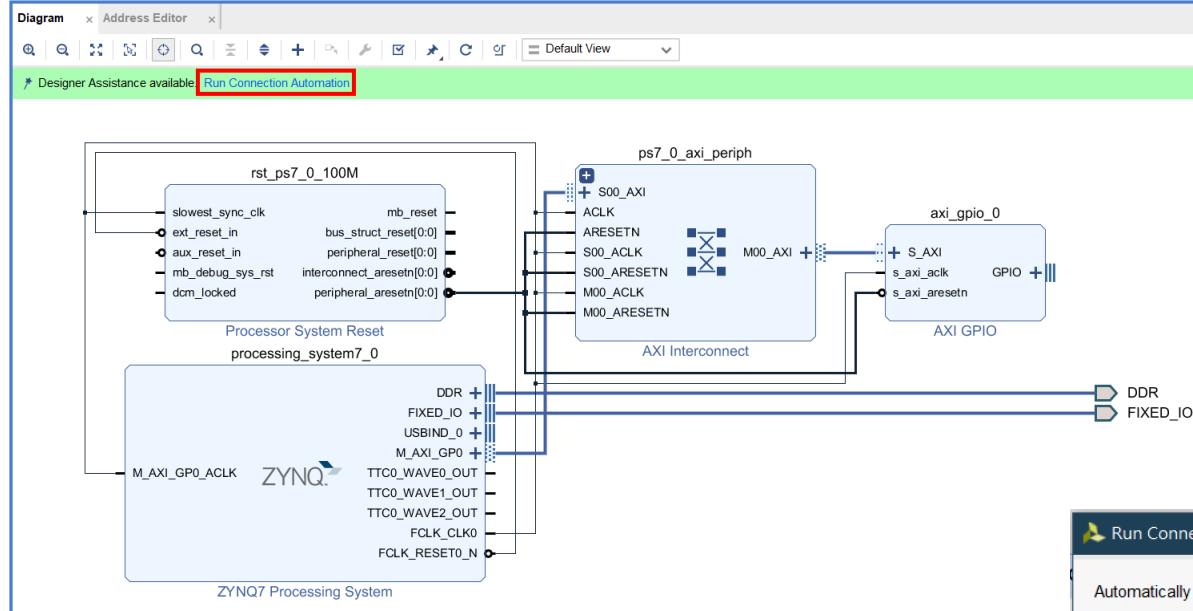

2

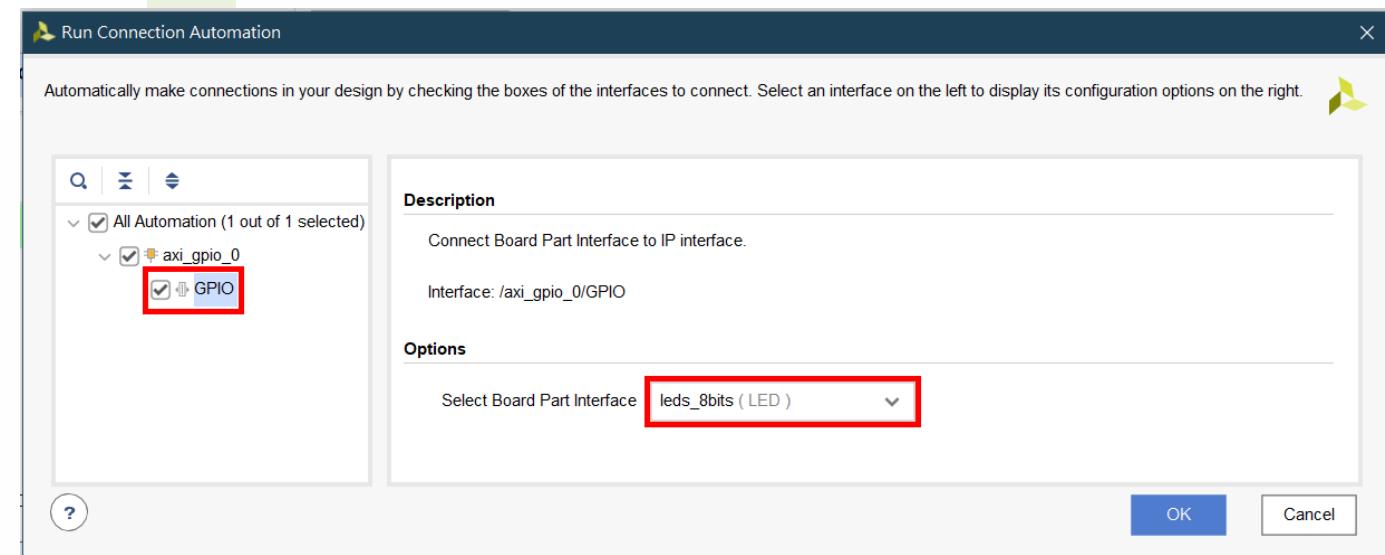

# Connect GPIO to on-board LEDs

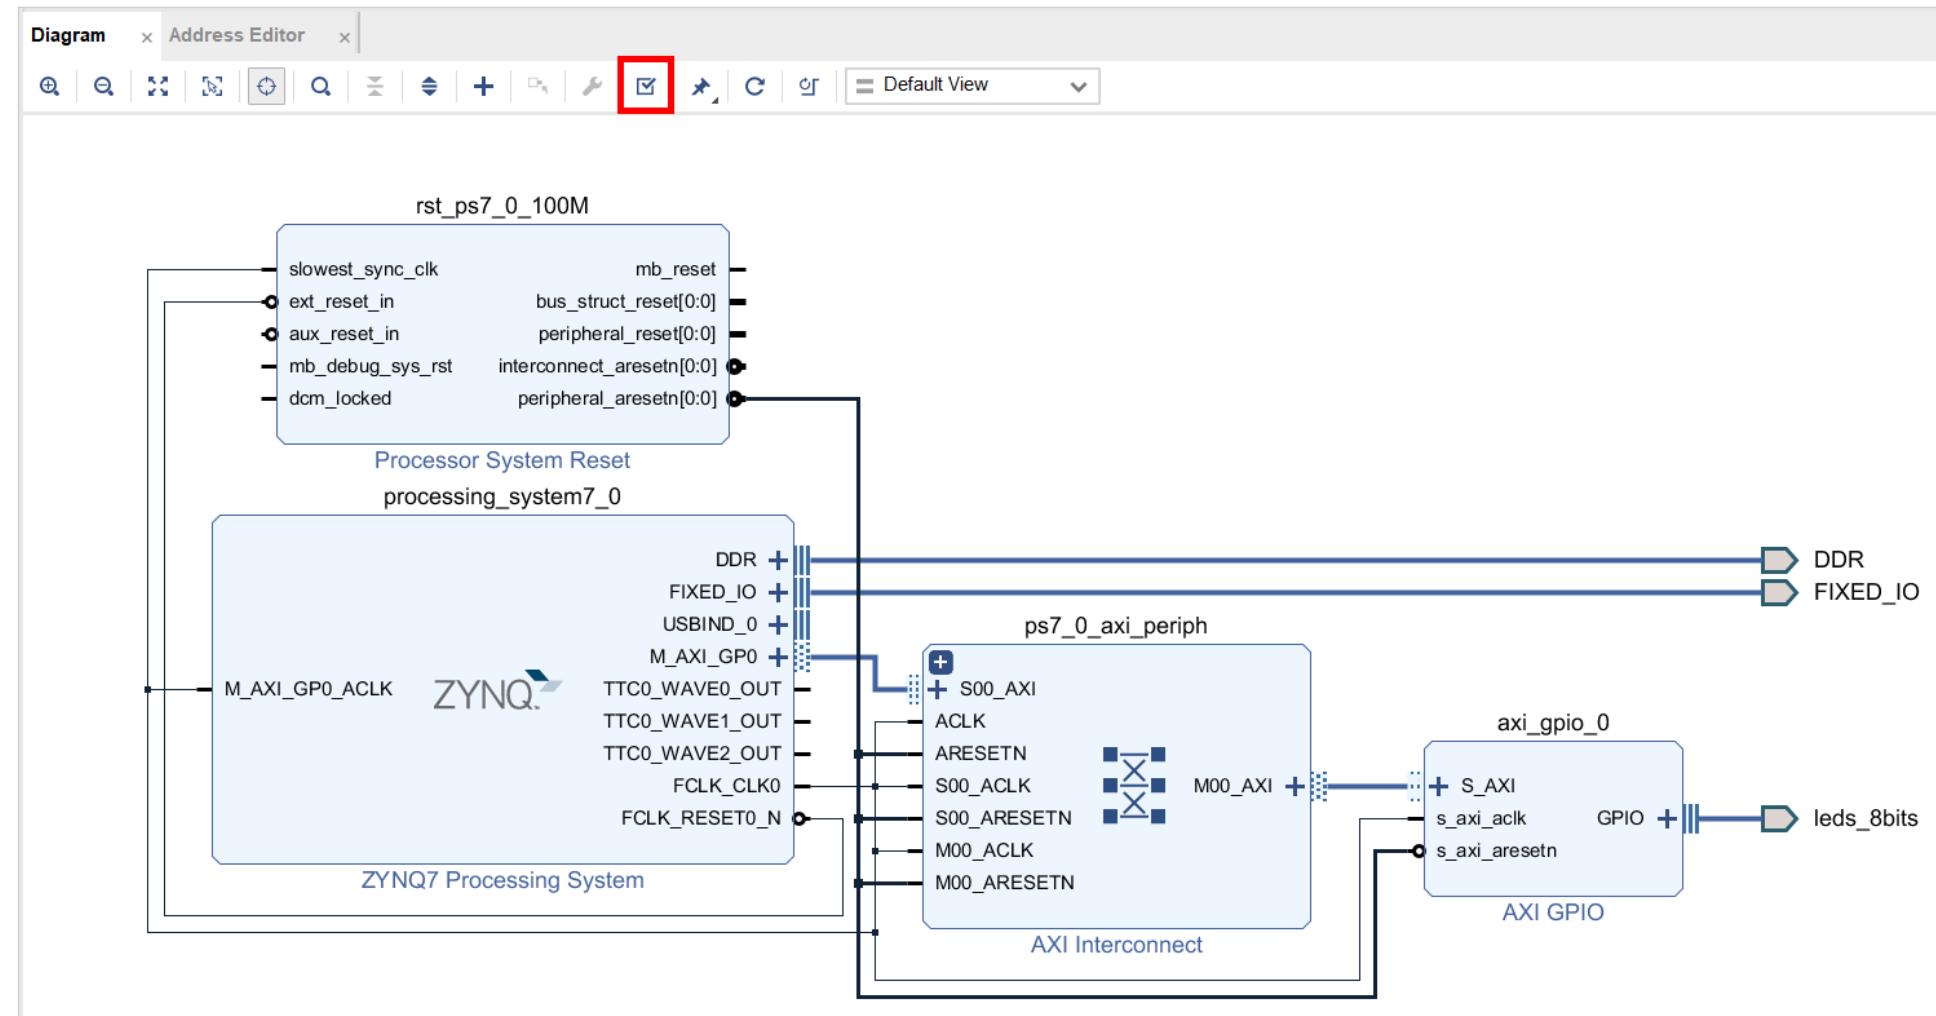

1

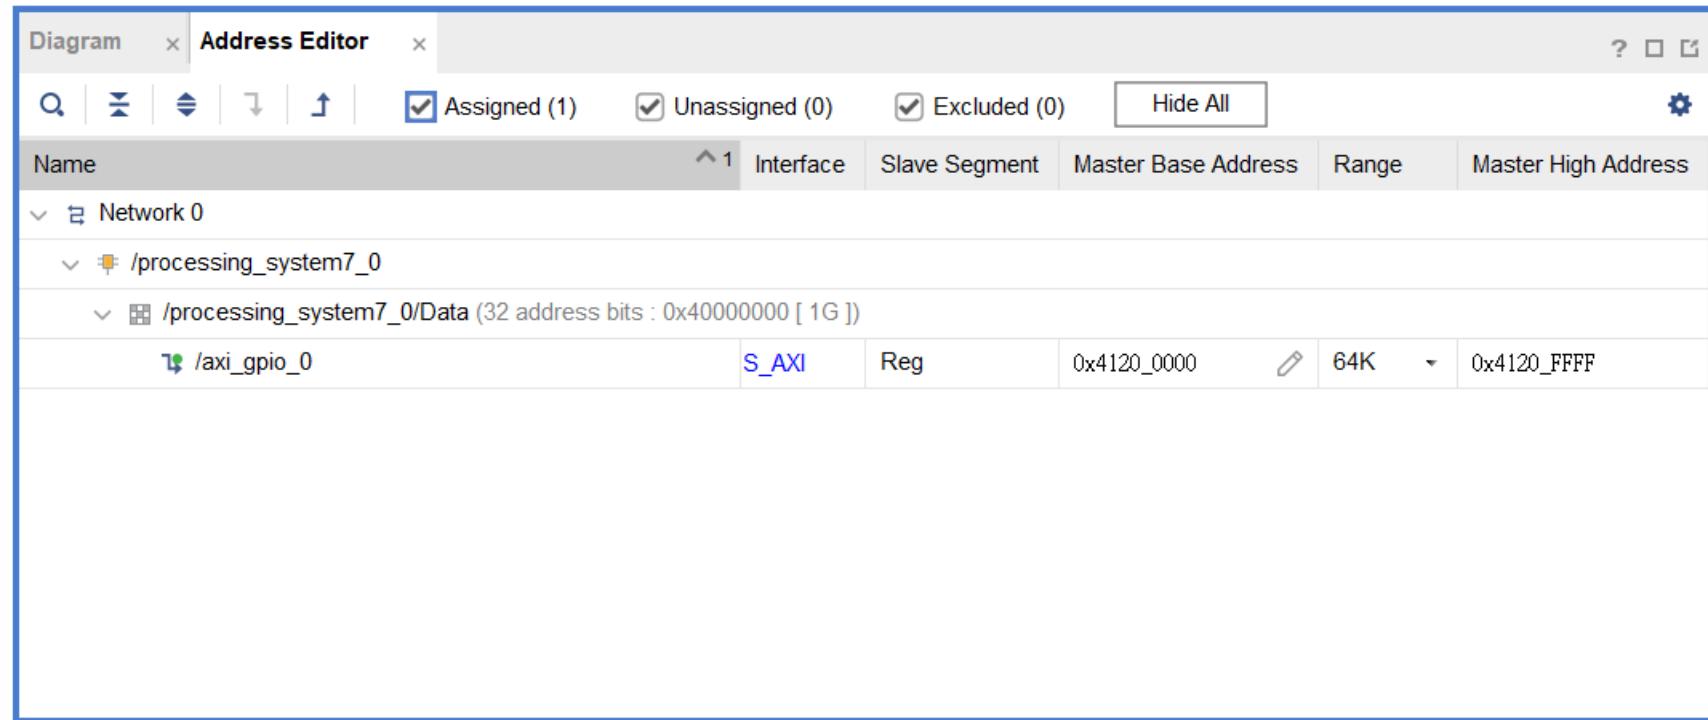

2

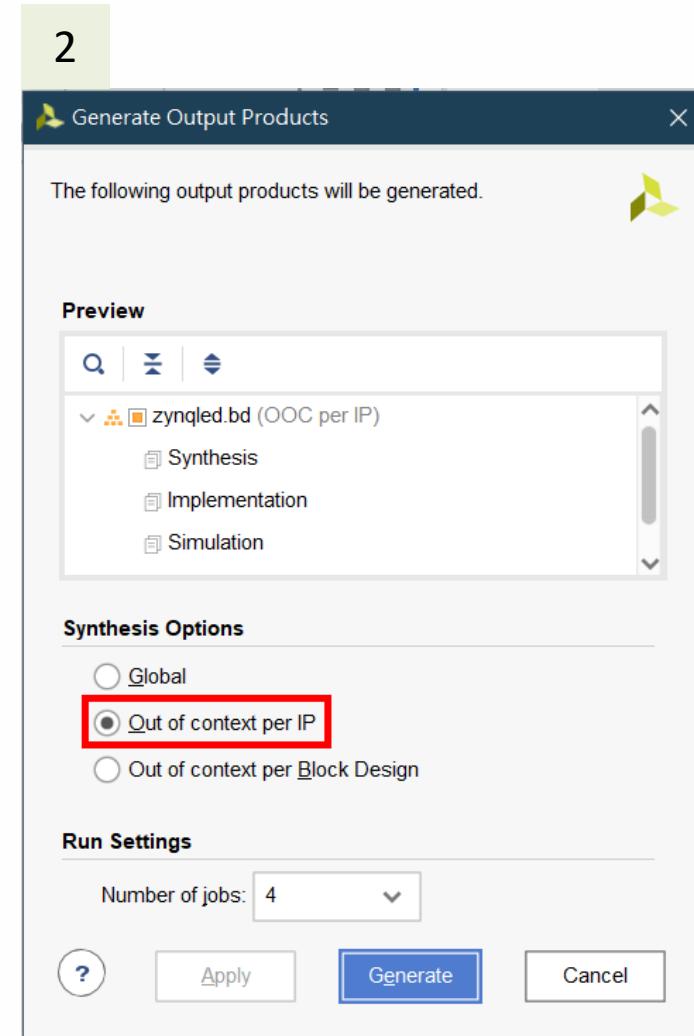

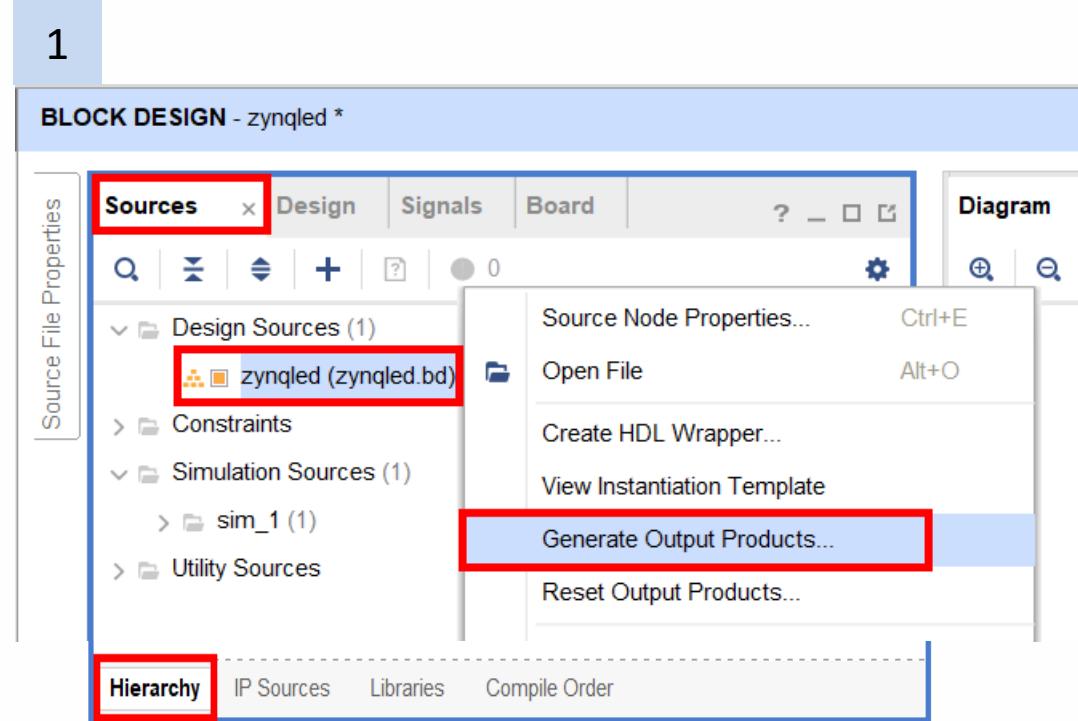

# Block design validation

# Block design address editor

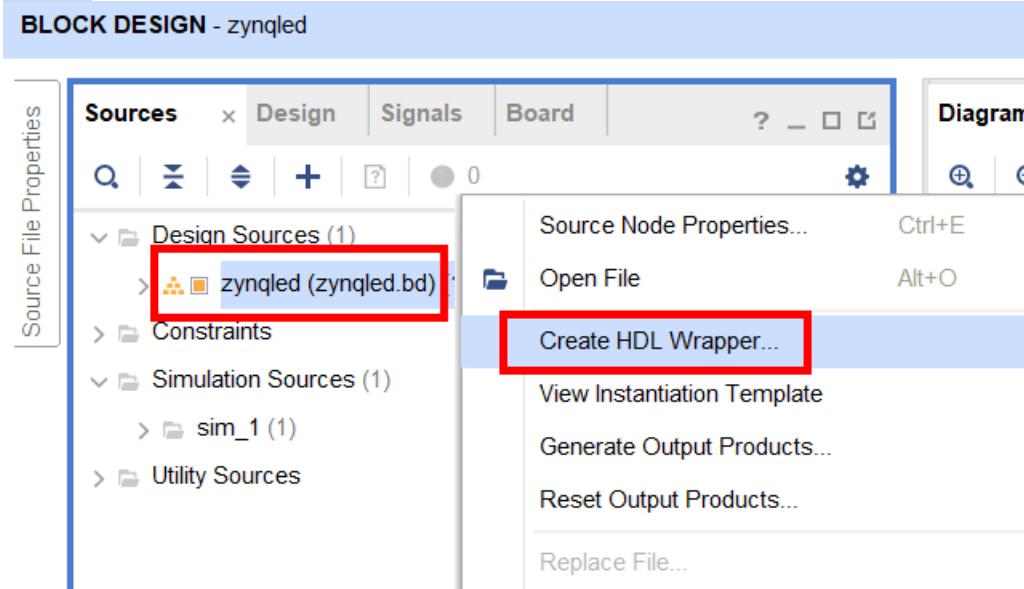

# Generate output products

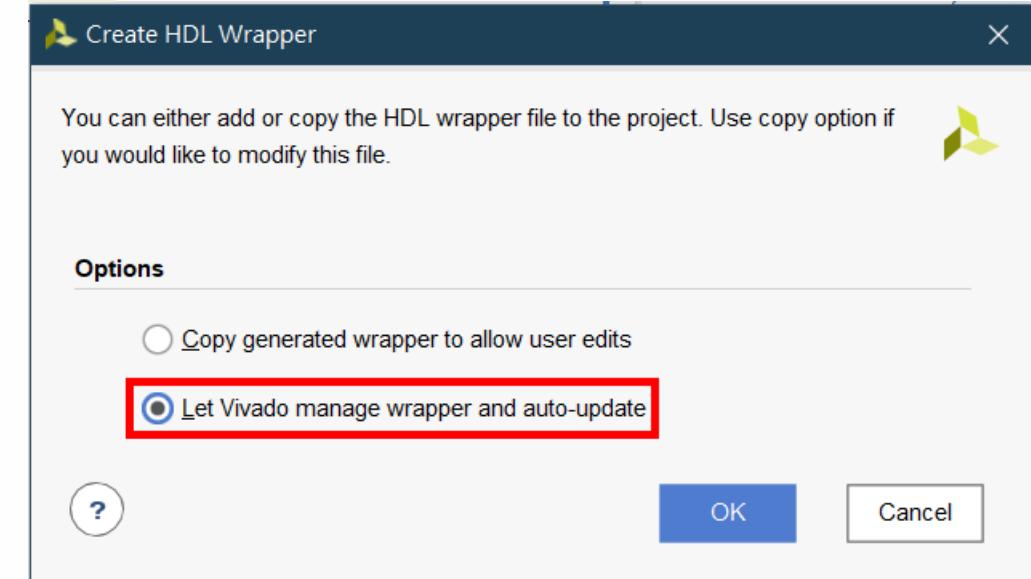

# Create HDL wrapper

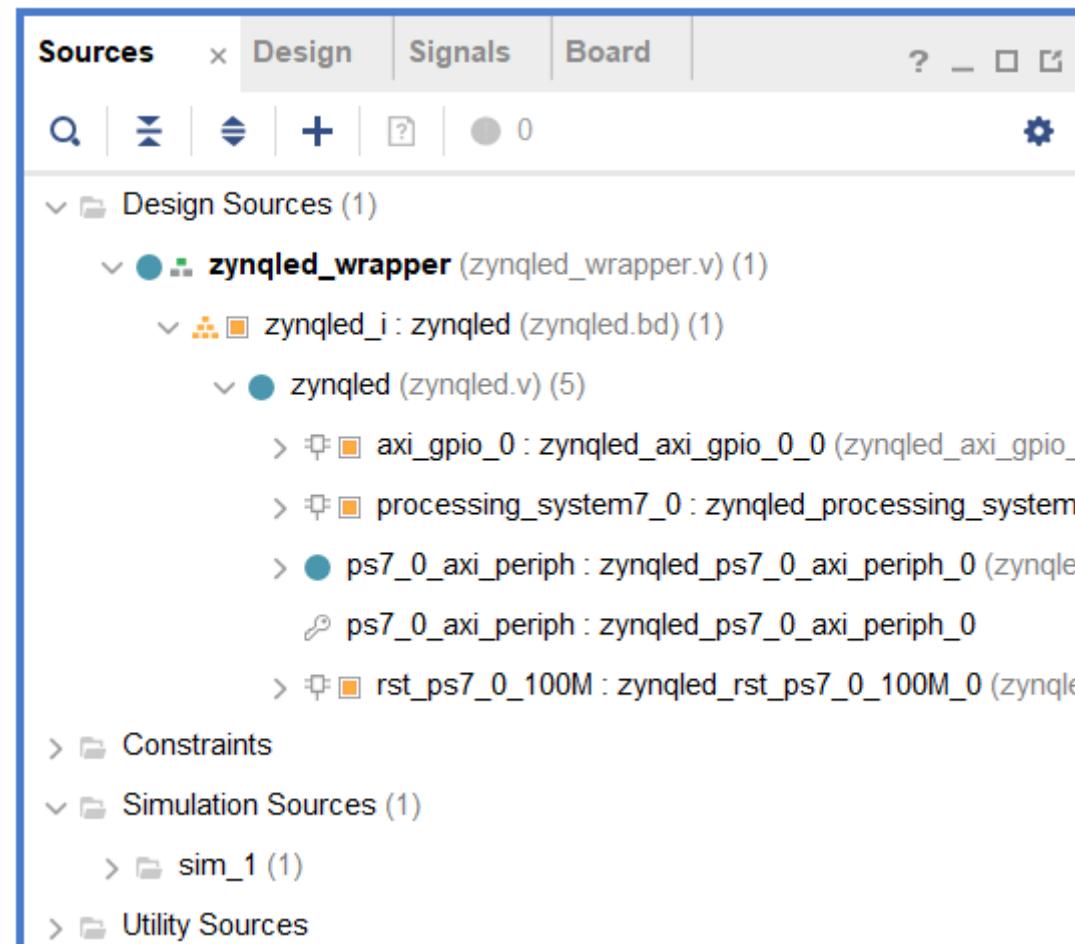

1

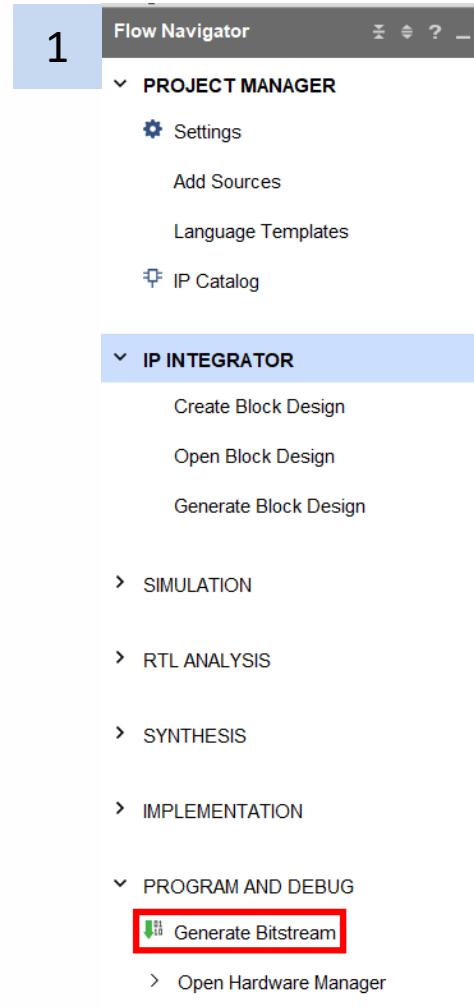

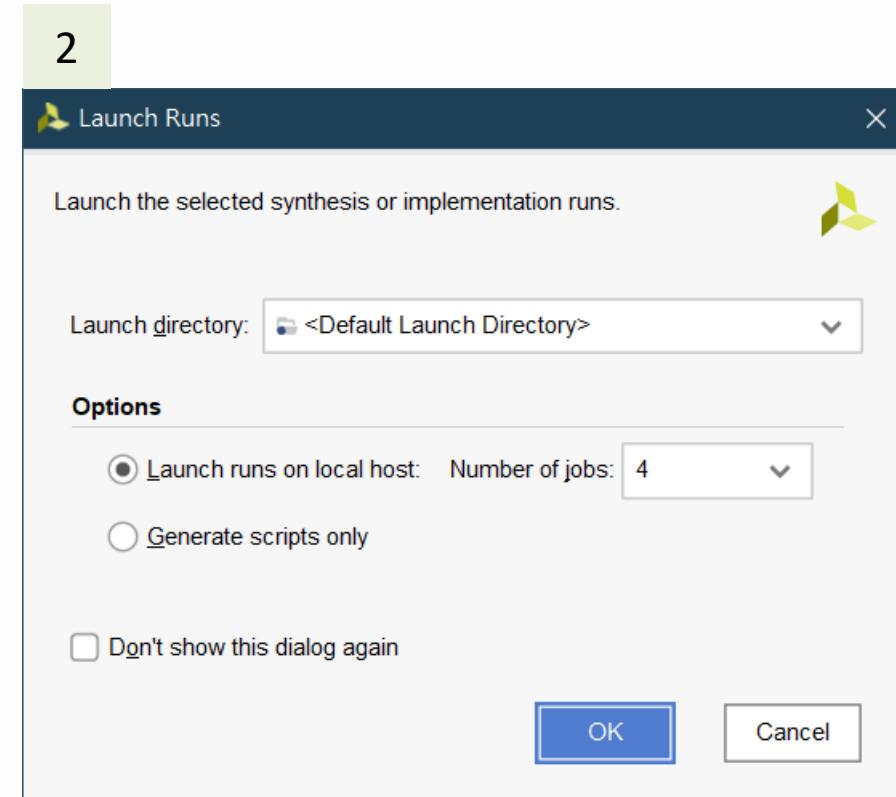

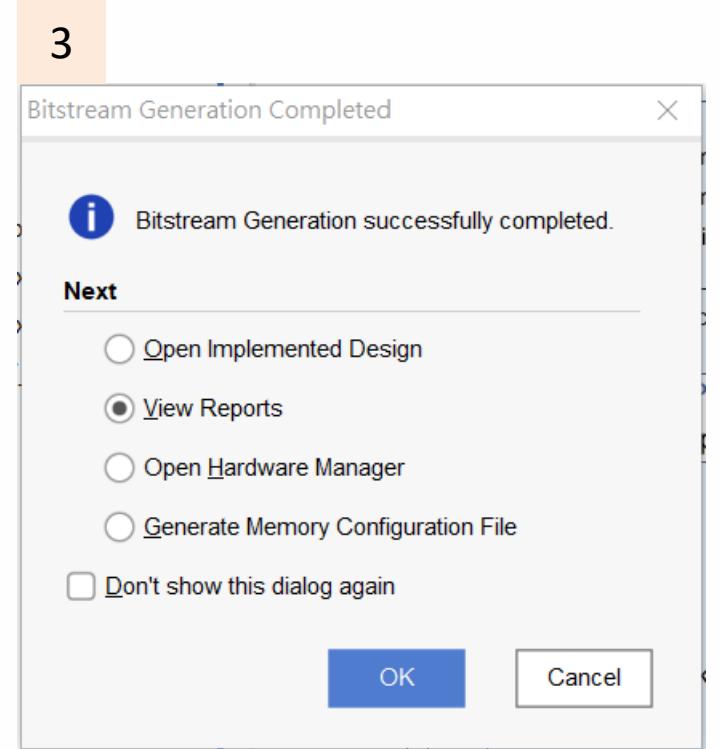

2

# Create HDL wrapper

# Generate Bitstream

- 1 The Flow Navigator interface shows the IP INTEGRATOR section selected. Other sections like PROJECT MANAGER, SIMULATION, RTL ANALYSIS, SYNTHESIS, IMPLEMENTATION, and PROGRAM AND DEBUG are also visible.
- 2 The Launch Runs dialog box is open, prompting the user to "Launch the selected synthesis or implementation runs." It includes a "Launch directory" dropdown set to "<Default Launch Directory>", an "Options" section with two radio button choices ("Launch runs on local host" selected, "Number of jobs: 4" dropdown), and a "Generate scripts only" option. A "Don't show this dialog again" checkbox is present at the bottom.
- 3 A confirmation dialog box titled "Bitstream Generation Completed" displays the message "Bitstream Generation successfully completed." It includes a "Next" section with several options: "Open Implemented Design" (radio button), "View Reports" (radio button selected), "Open Hardware Manager" (radio button), "Generate Memory Configuration File" (radio button), and a "Don't show this dialog again" checkbox. "OK" and "Cancel" buttons are at the bottom.

# Export XSA (hardware specification)

1

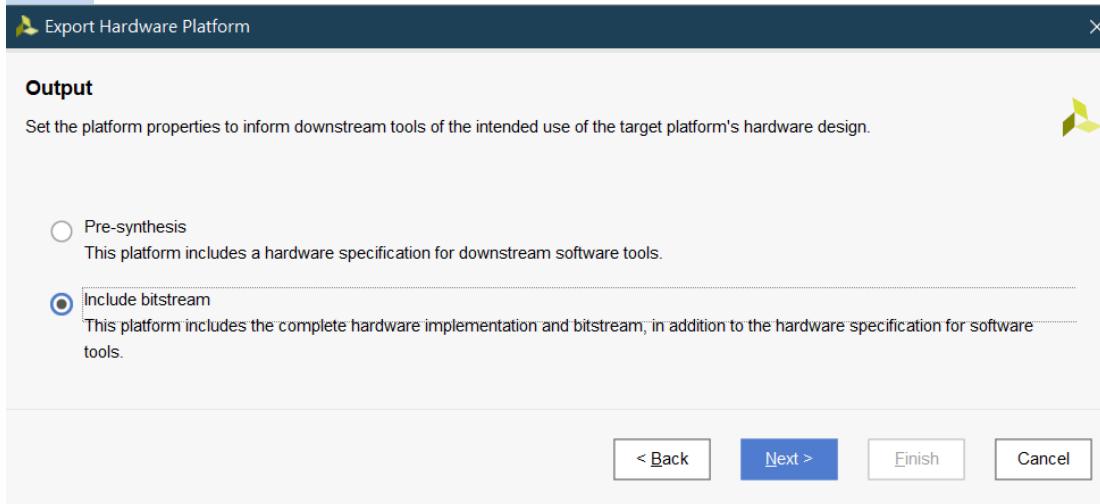

The screenshot shows the Vivado 2018.2 interface with the 'File' menu highlighted by a red box. The 'Export' option in the dropdown menu is also highlighted by a red box. The main window displays an implemented design for a Zynq-7000 device.

2

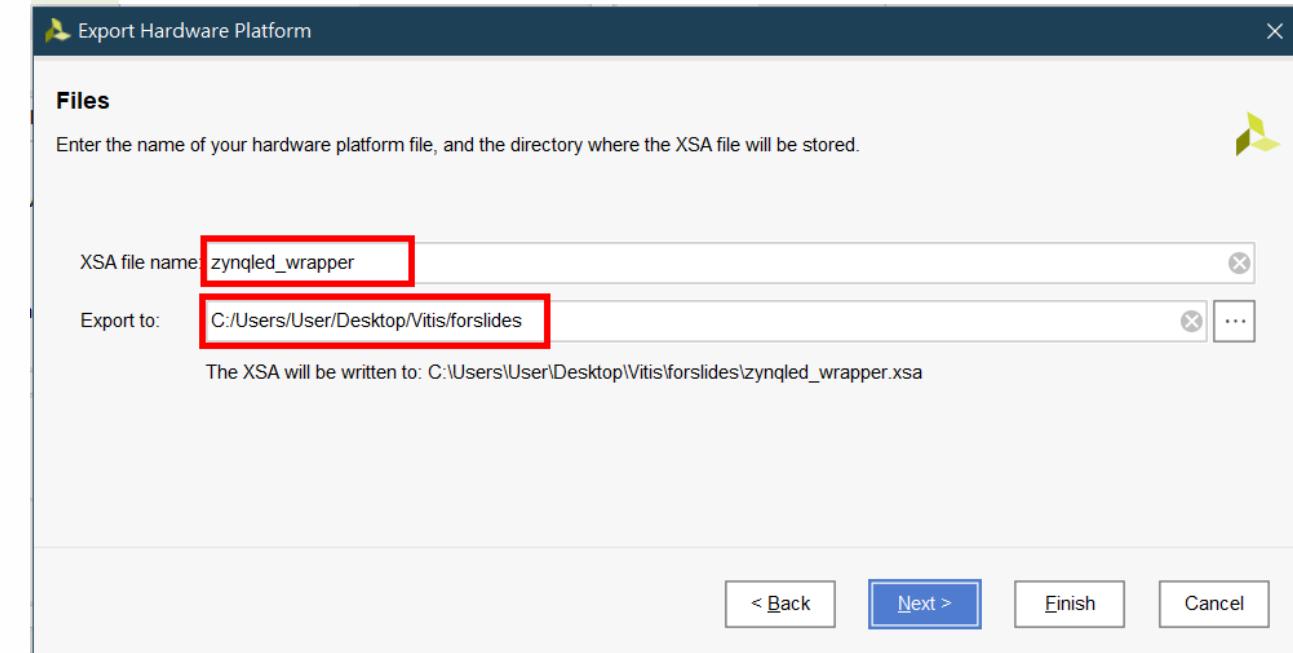

The screenshot shows the 'Export Hardware Platform' wizard. The title bar says 'Export Hardware Platform'. The main area is titled 'Export Hardware Platform' and contains the text: 'This wizard will guide you through the export of a hardware platform for use in the Vitis or Petalinux software tools.' Below this, there is a section titled 'Platform type' with two options: 'Fixed' (selected) and 'Expandable'. The 'Fixed' option is described as 'A platform supporting embedded software development only.' The 'Expandable' option is described as 'A platform supporting acceleration.' Navigation buttons at the bottom include '< Back', 'Next >', 'Finish', and 'Cancel'.

# Export XSA (hardware specification)

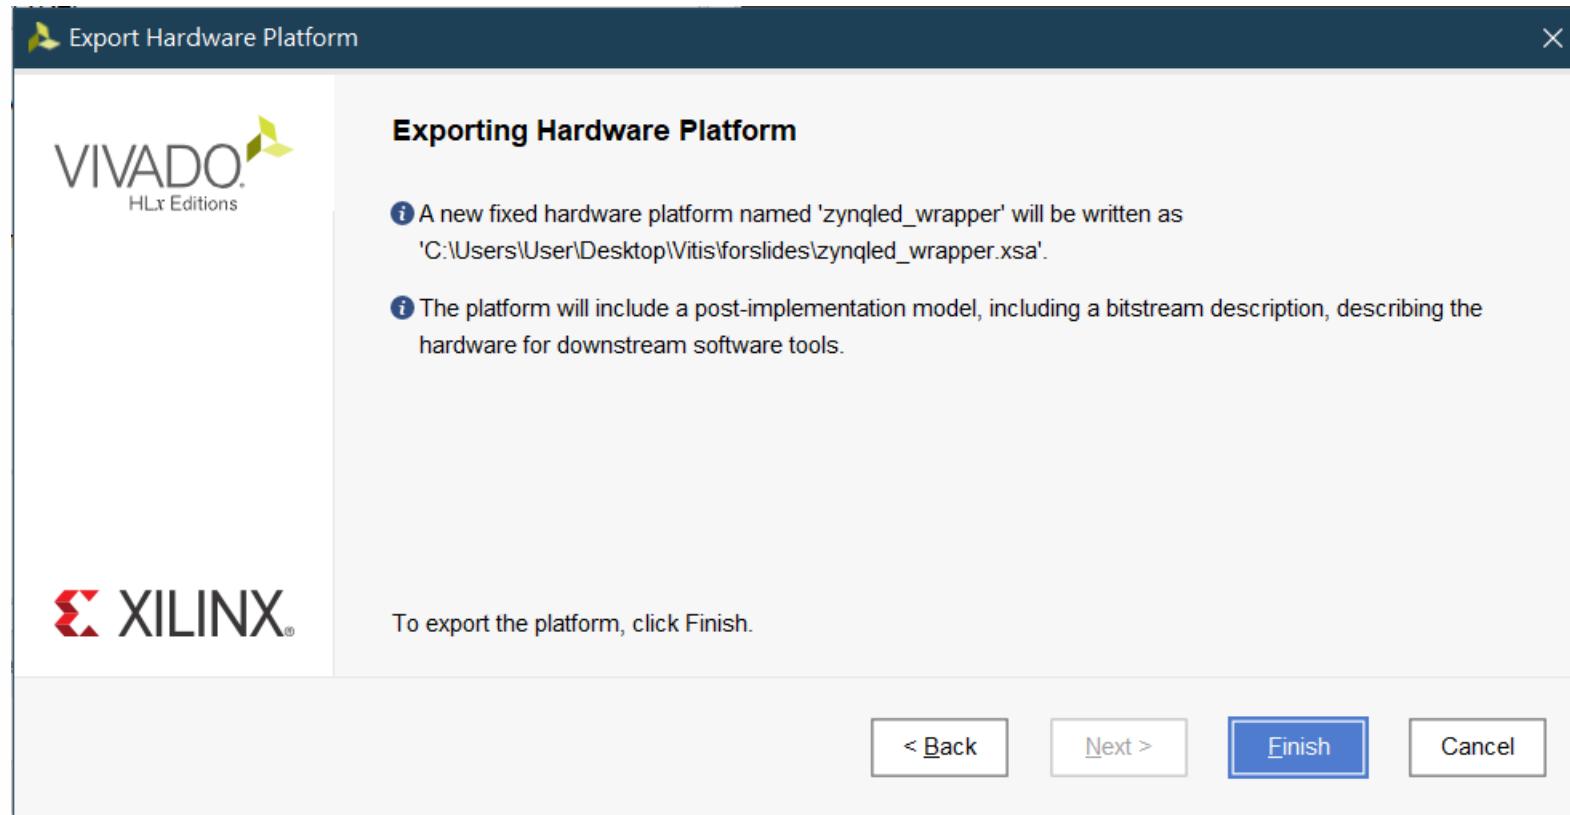

1

2

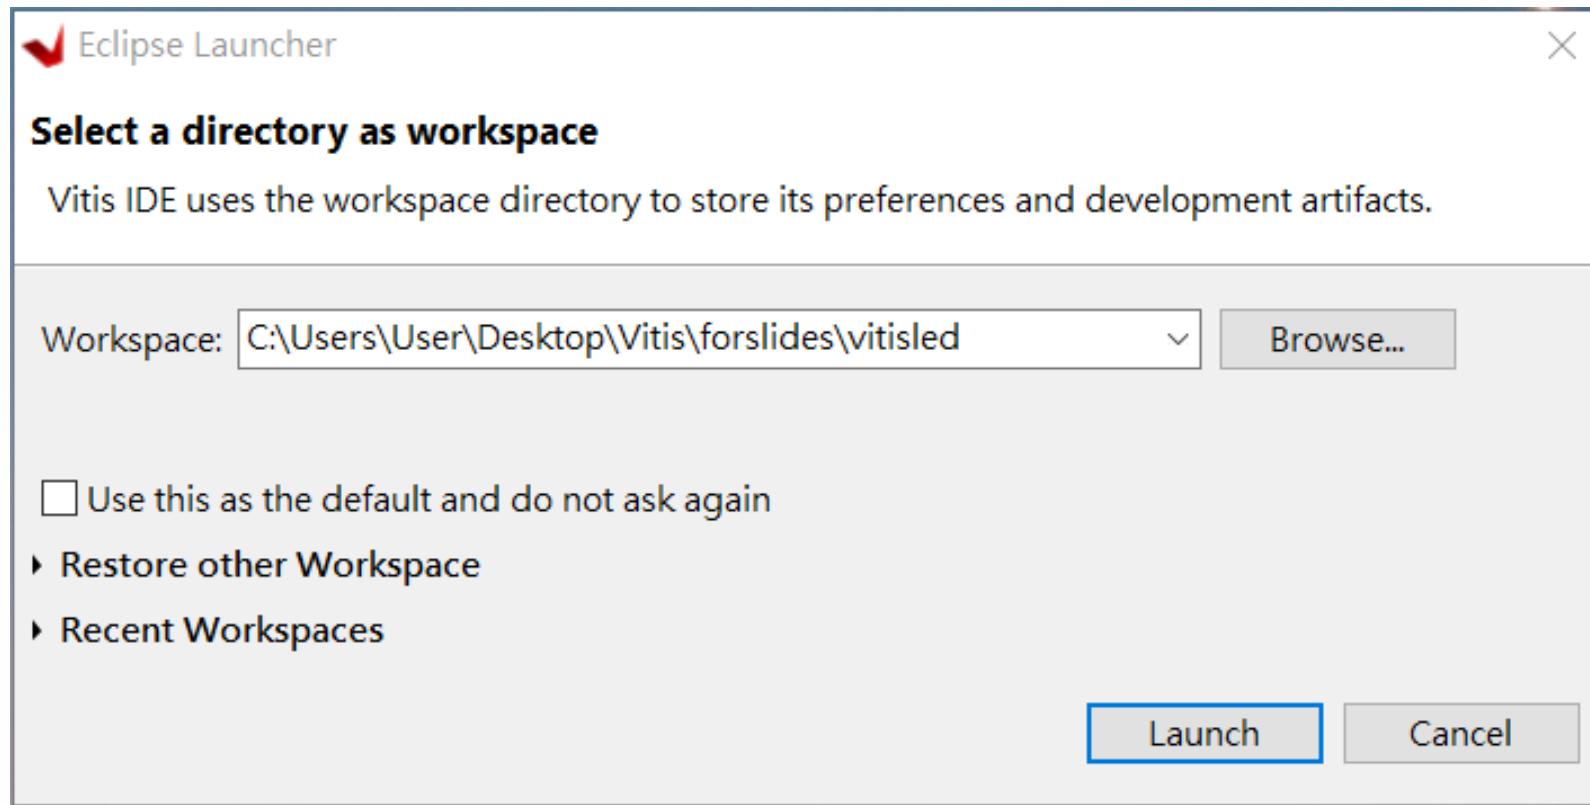

# Export XSA (hardware specification)

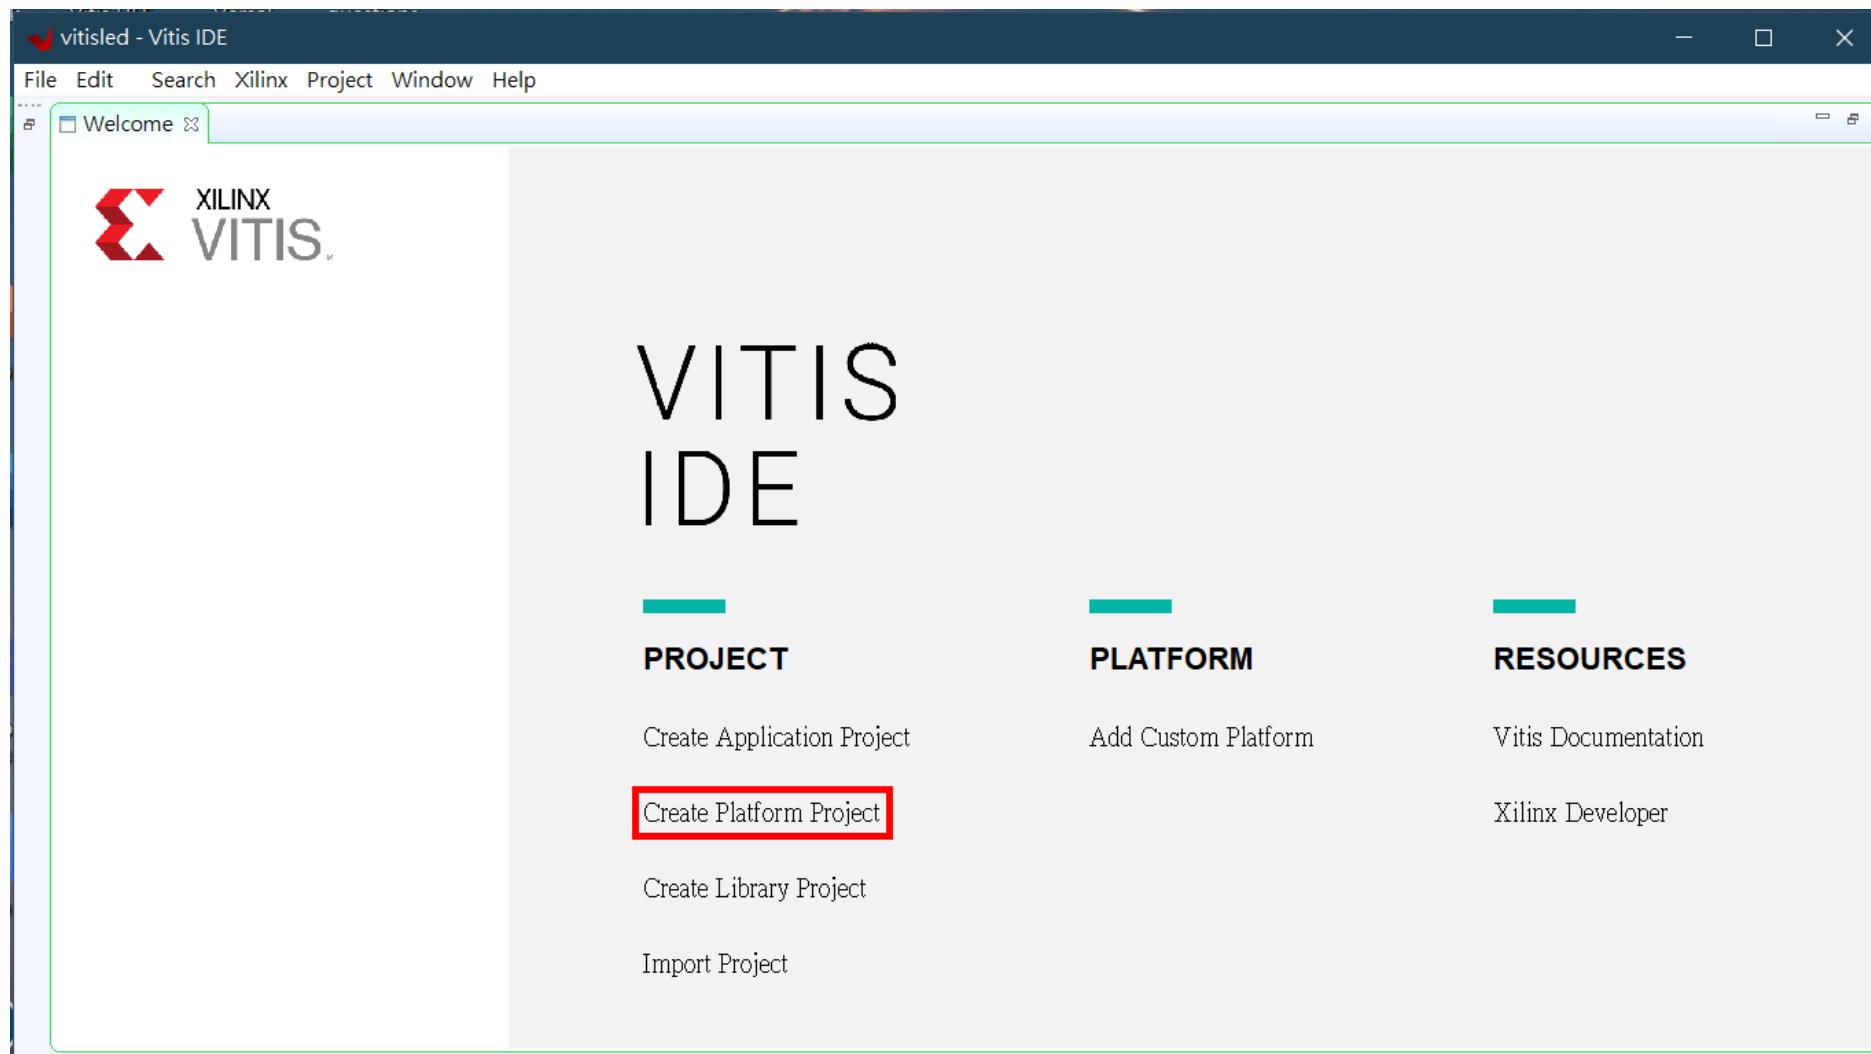

# Xilinx Vitis build

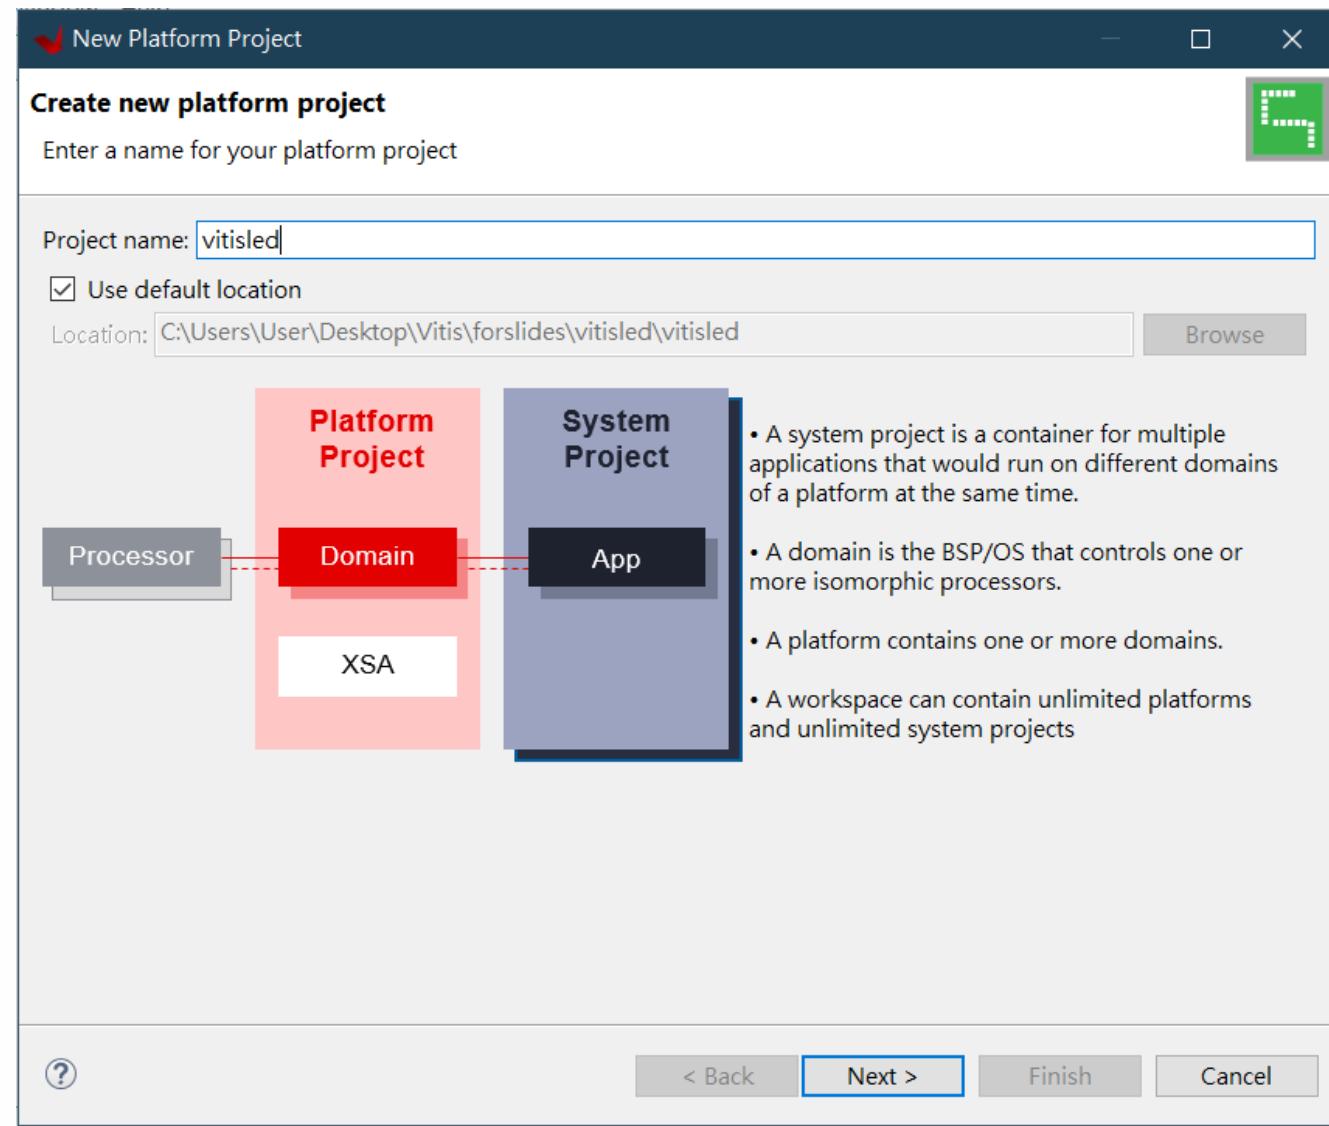

# Launch Vitis

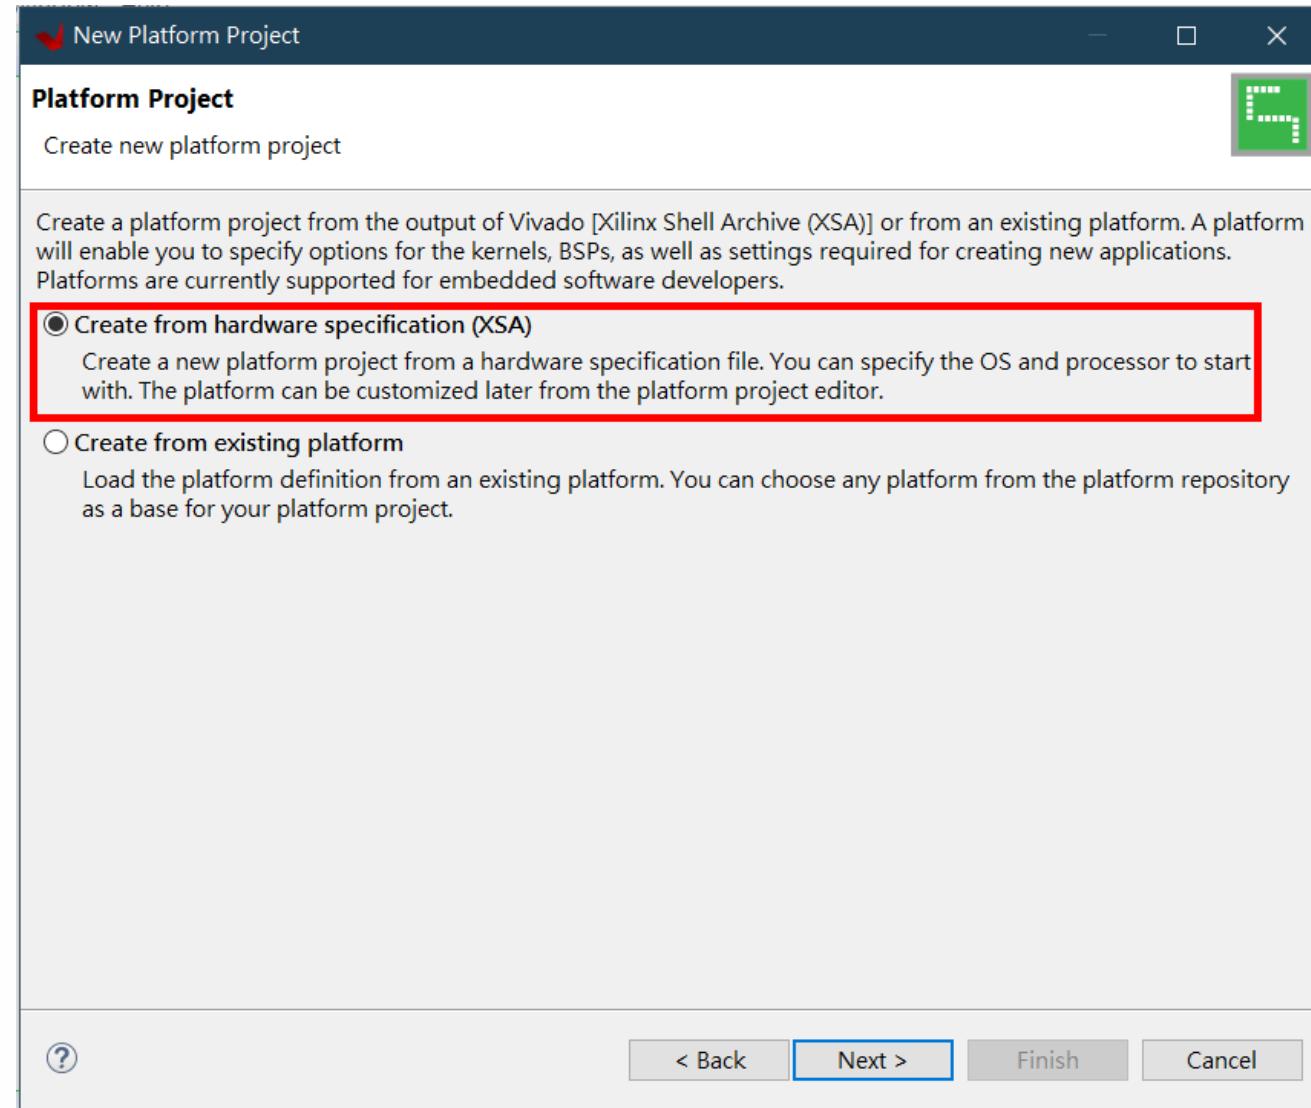

# Create platform project

# Create platform project

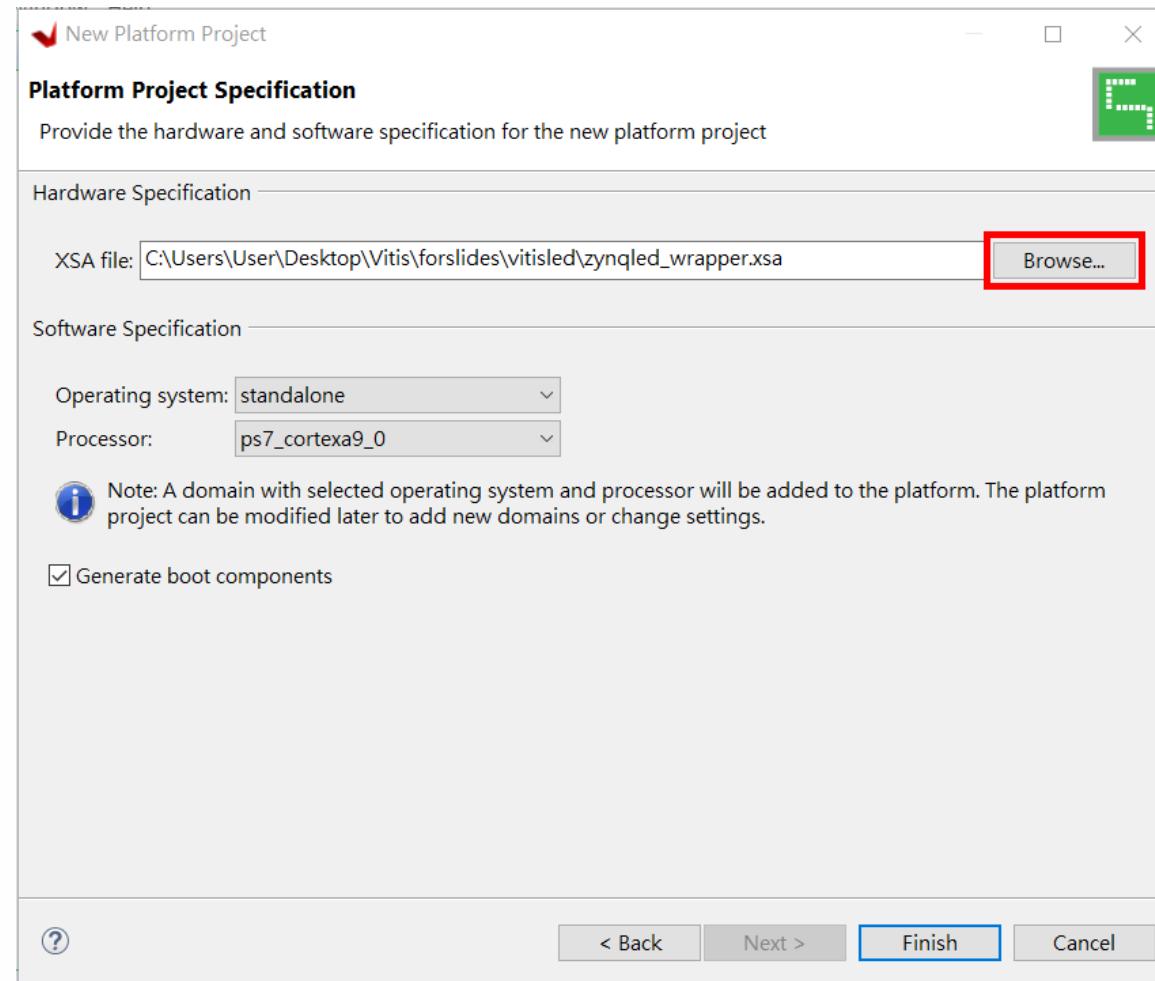

# Create platform project

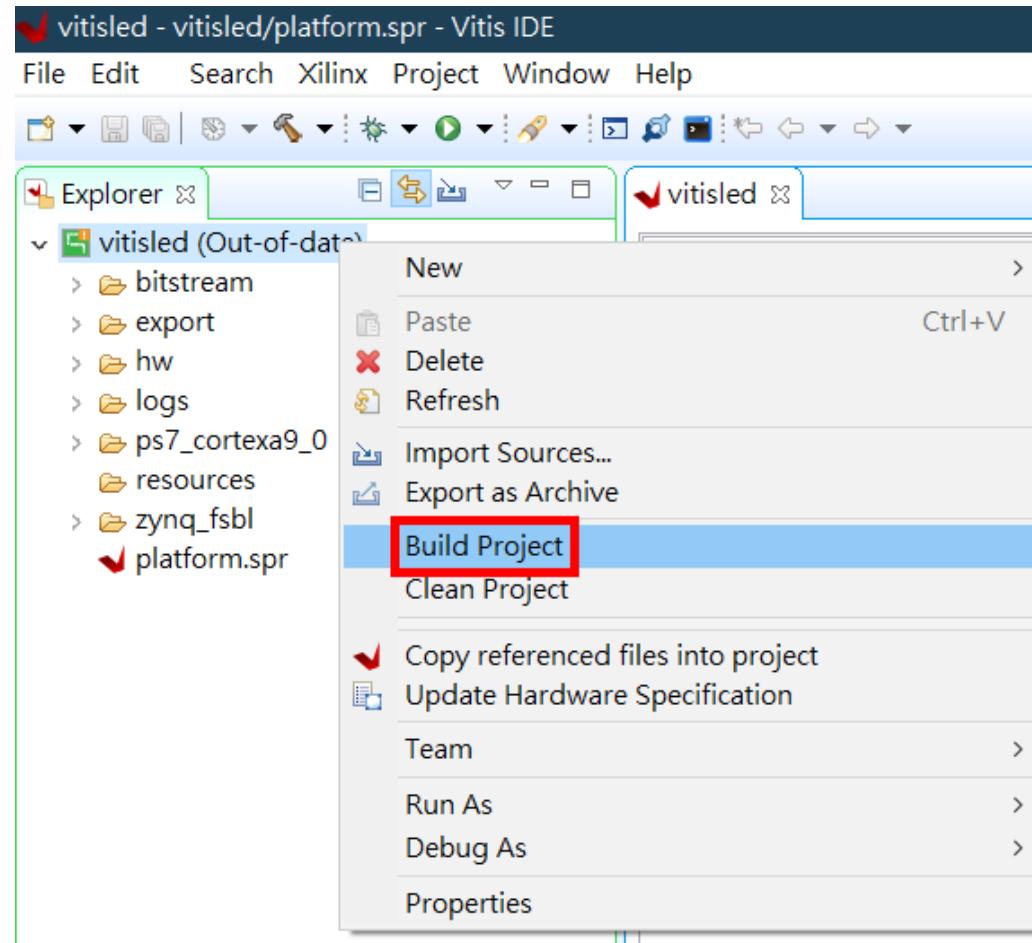

# Create platform project

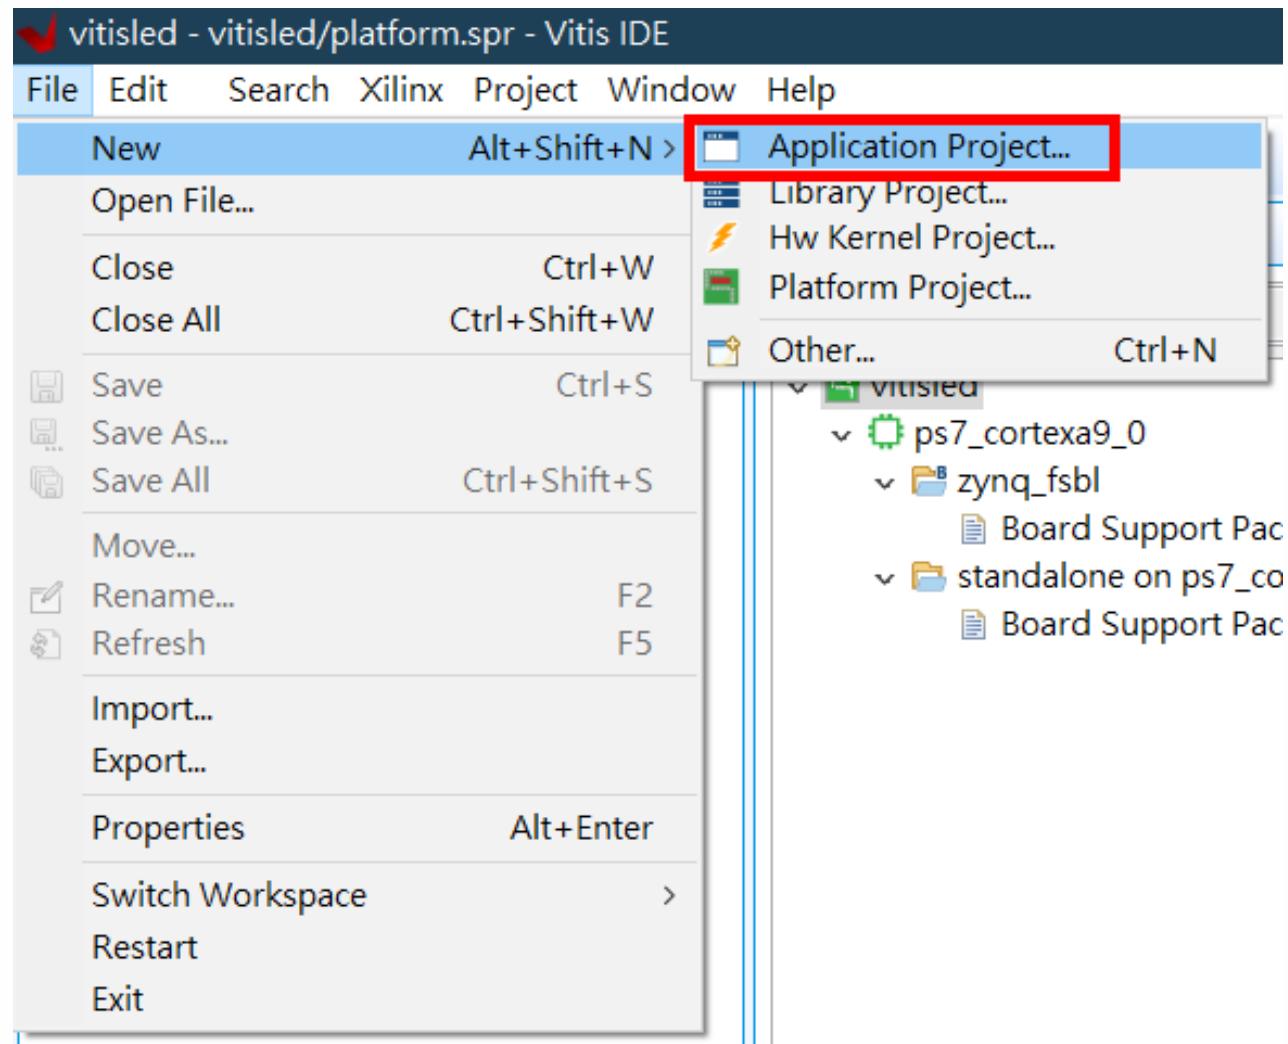

- ◆ In this step, select the .xsa file which was created previously.

# Build platform

# Create applications

# Create applications

New Application Project

## Create a New Application Project

This wizard will guide you through the 4 steps of creating new application projects.

1. Choose a **platform** or create a platform project from Vivado exported XSA
2. Put application project in a **system** project, associate it with a processor
3. Prepare the application runtime – domain
4. Choose a template for application to quick start development

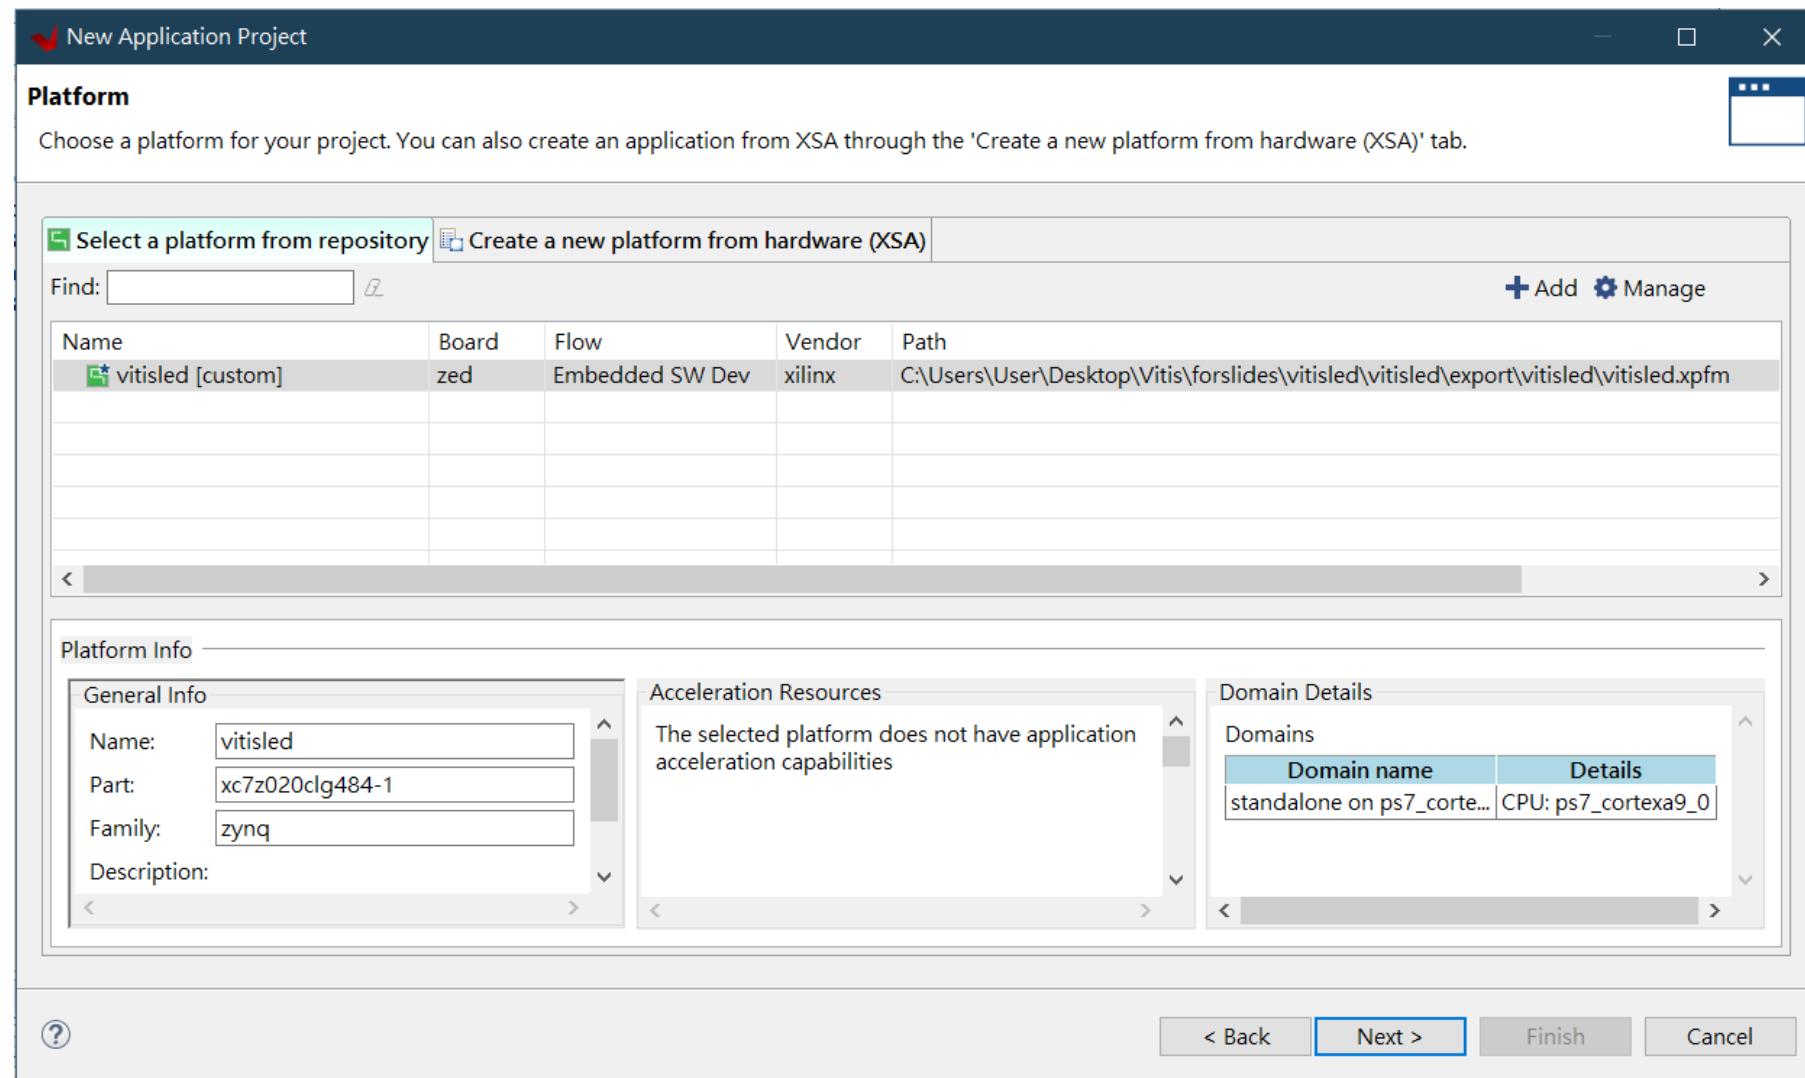

The diagram illustrates the architecture of an application project. A 'Processor' is connected to a 'Domain' (represented by a red rectangle). The 'Domain' is part of a 'Platform Project' (red box) which also contains an 'XSA' (Vivado Exported XSA). This 'Platform Project' is associated with a 'System Project' (blue box), which contains an 'App' (black rectangle).

- A platform provides hardware information and software environment settings.
- A system project contains one or more applications that run at the same time.
- A domain provides runtime for applications, such as operating system or BSP.
- A workspace can contain unlimited platforms and unlimited system projects.

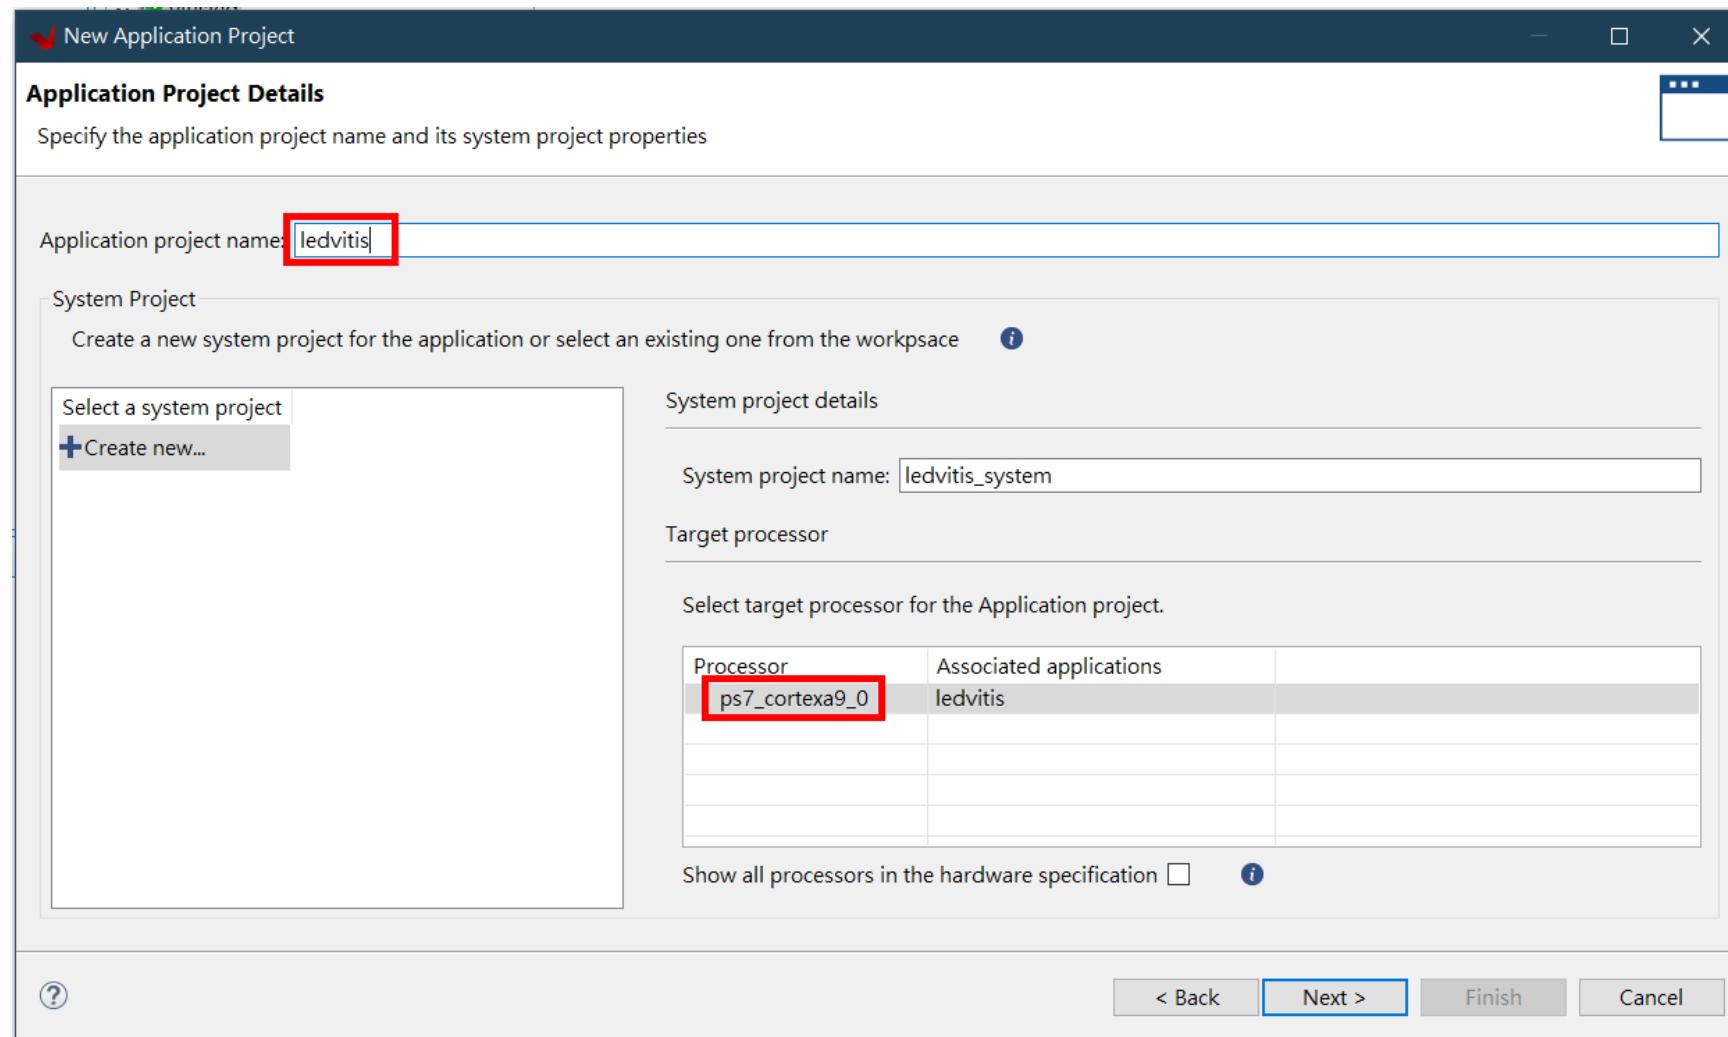

Skip welcome page next time. (Can be reached with Back button)

# Add a new source to “src”

The screenshot shows the Vitis IDE interface. On the left, the Explorer view displays the project structure under 'ledvitis\_system [ vitisled ]'. It includes a 'src' folder containing 'main.c', 'lscript.ld', 'README.txt', 'Xilinx.spec', and a '.ide' folder with 'ledvitis.prj' and 'ledvitis\_system.sprj'. Other folders like 'bitstream', 'export', and 'hw' are also listed. On the right, the main editor window shows the 'main.c' file with the following code:

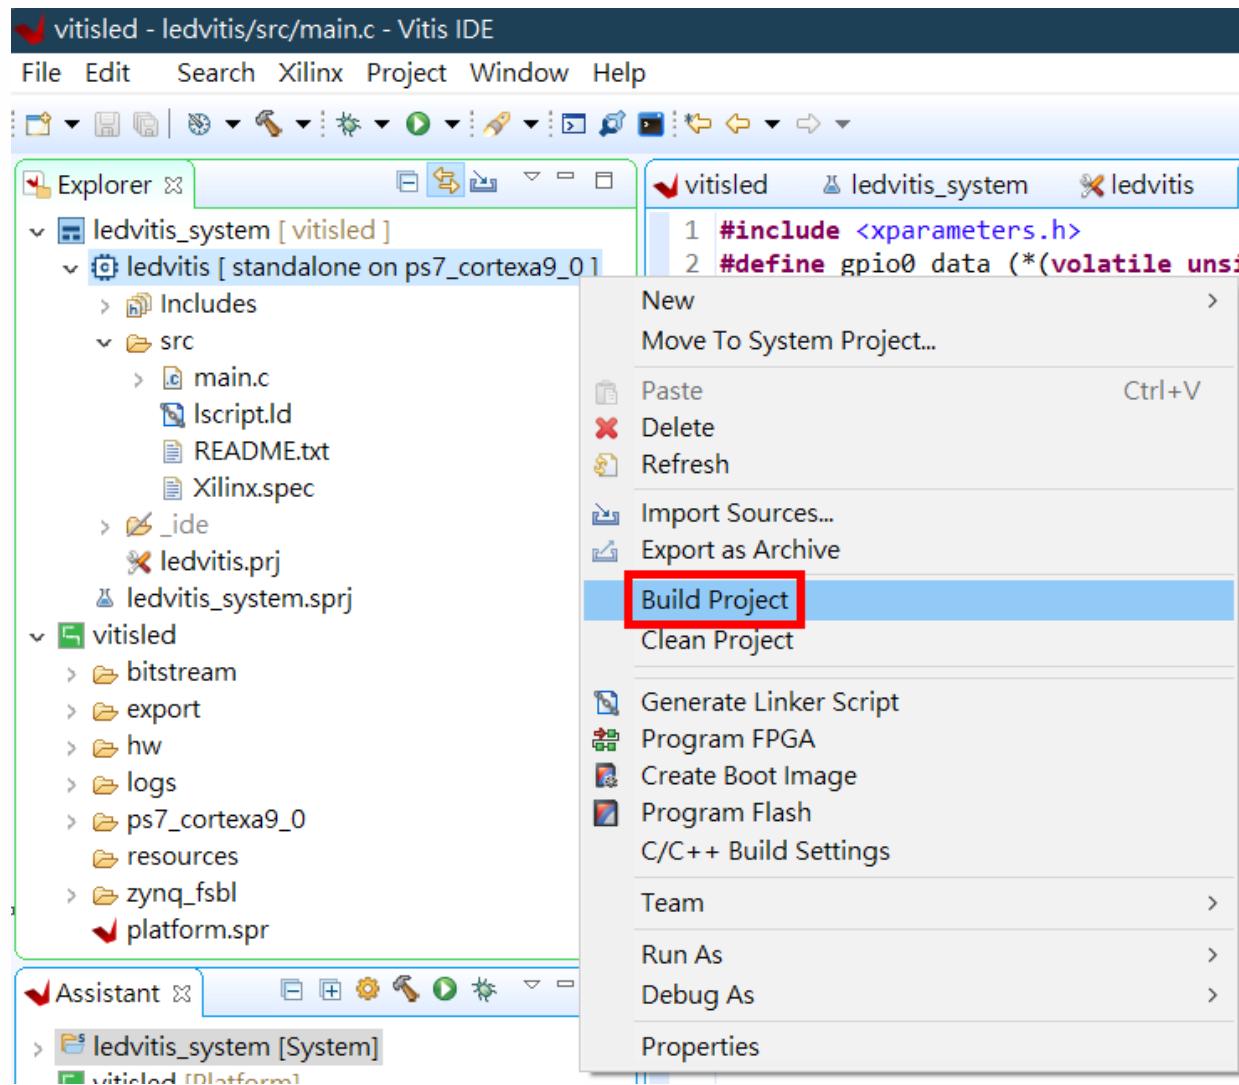

```
#include <xparameters.h>
#define gpio0_data (*(volatile unsigned long *)(XPAR_AXI_GPIO_0_BASEADDR + 0x00))

int main(void)
{
    unsigned int i = 1,j;
    while(1)
    {
        gpio0_data = i;
        for(j=0;j<10000000;j++);
        if(i ==0x80) i = 1;
        else i = i << 1;
    }
}
```

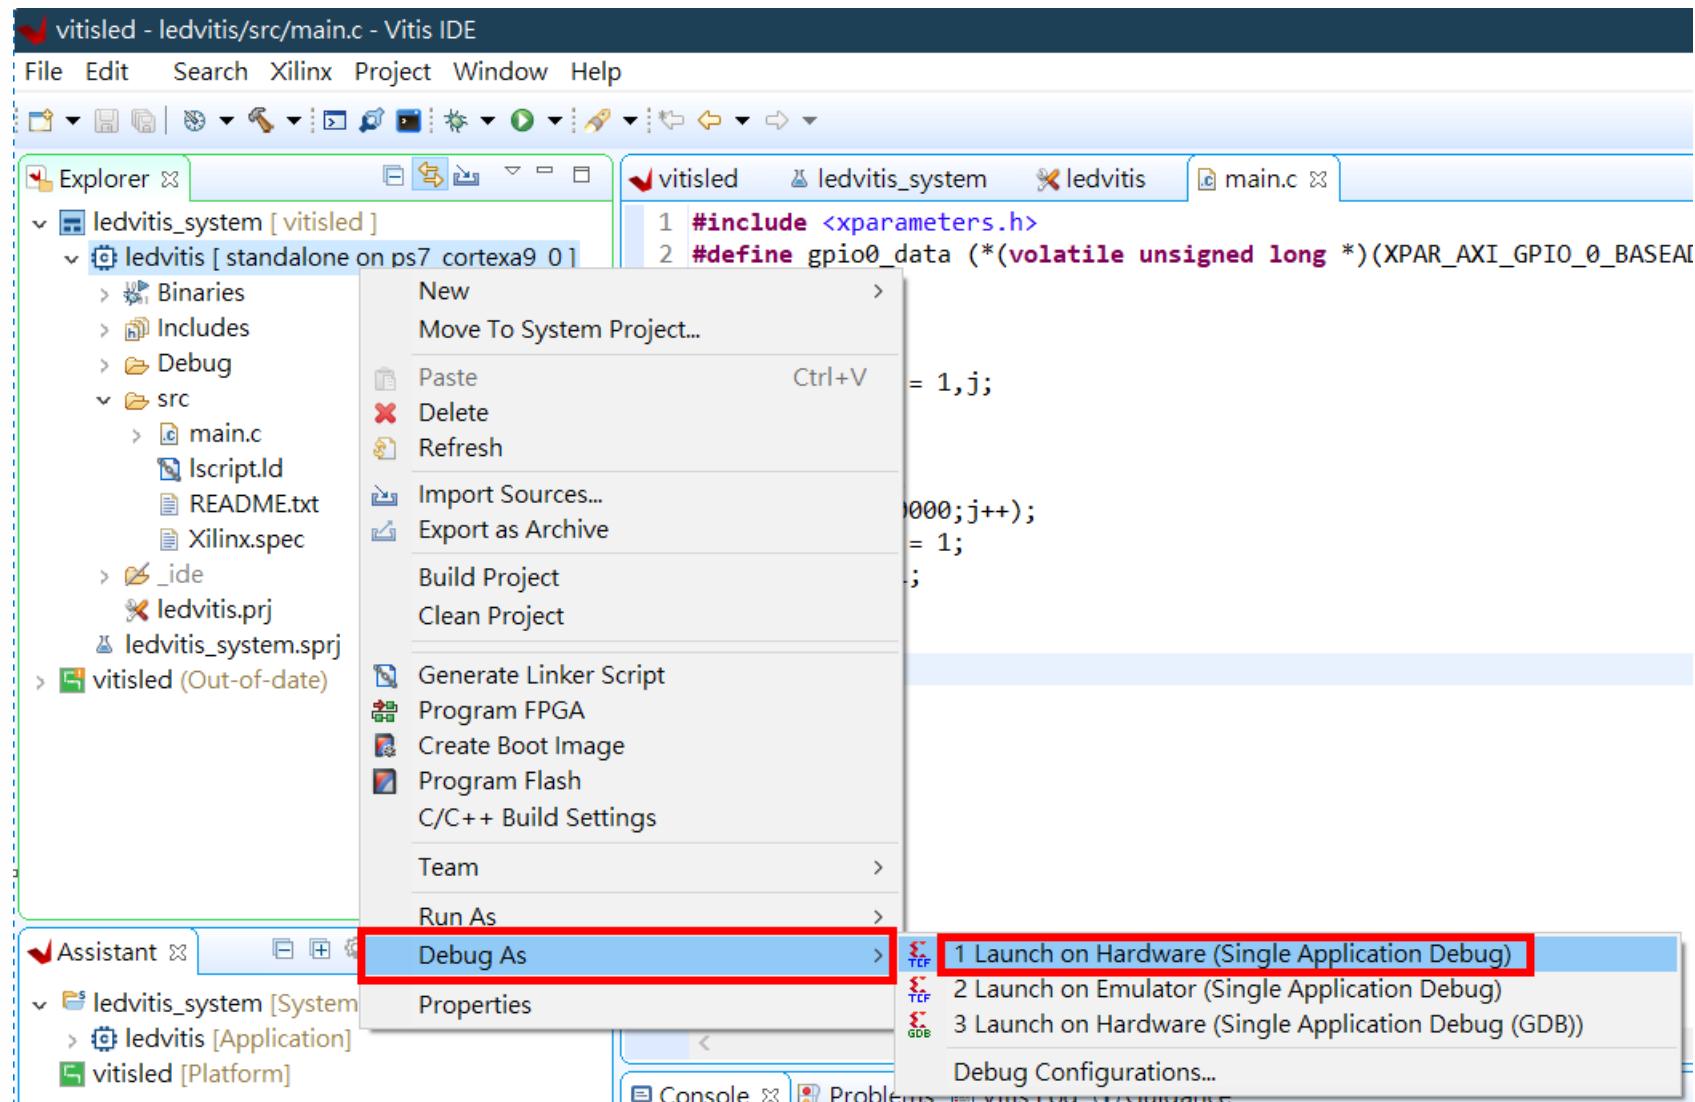

```
#include <xparameters.h>
#define gpio0_data (*(volatile unsigned long *)(XPAR_AXI_GPIO_0_BASEADDR + 0x00))

int main(void)
{
    unsigned int i = 1,j;
    while(1)
    {
        gpio0_data = i;
        for(j=0;j<10000000;j++);
        if(i ==0x80) i = 1;
        else i = i << 1;
    }
}
```

# Board support package

# Modify BSP settings

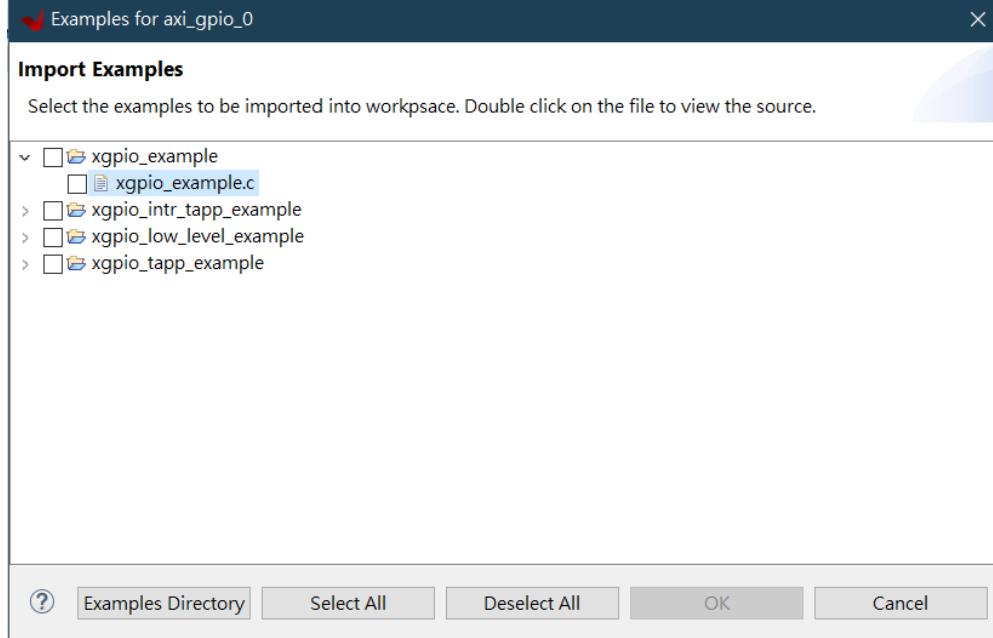

# Examples

The screenshot shows the Vitis IDE interface with the project 'vitisled' selected in the top bar. The main window displays the 'Board Support Package' configuration for the 'ps7\_cortexa9\_0' board. The left sidebar shows the project structure with 'vitisled (Out-of-date)' expanded, revealing 'ps7\_cortexa9\_0', 'zynq\_fsbl', and 'standalone on ps7\_cortexa9\_0'. The right pane contains the 'Board Support Package' settings, including options to 'Modify BSP Settings...' or 'Reset BSP Sources'. A note states that a BSP settings file is generated based on user options. Below this, there are sections for 'Operating System' (set to 'standalone v7.2'), 'Description' (Standalone), and 'Documentation' (link to 'standalone v7.2'). The 'Drivers' tab of a table view is selected, showing a list of drivers with columns for Name, Driver, Documentation, and Examples. The 'Import Examples' link in the 'Examples' column for the first driver is highlighted with a red box.

Name	Driver	Documentation	Examples
axi_gpio_0	gpio	<a href="#">Documentation Link</a>	<a href="#">Import Examples</a>
ps7_afi_0	generic	-	-
ps7_afi_1	generic	-	-
ps7_afi_2	generic	-	-
ps7_afi_3	generic	-	-
ps7_coresight_comp_0	coresightps_dcc	<a href="#">Documentation Link</a>	-

2

The screenshot shows the content of the file 'xgpio\_example.c'. The code is a C program example for an AXI GPIO driver. It includes comments about copyright, license, and modification history. The code defines include files and constant definitions.

```
/*
 * Copyright (C) 2002 - 2020 Xilinx, Inc. All rights reserved.
 * SPDX-License-Identifier: MIT
 */

/**
 * @file xgpio_example.c
 *
 * This file contains a design example using the AXI GPIO driver (XGpio) and
 * hardware device. It only uses channel 1 of a GPIO device and assumes that
 * the bit 0 of the GPIO is connected to the LED on the HW board.
 *
 * <pre>
 * MODIFICATION HISTORY:
 * -----
 * Ver Who Date Changes
 * -----
 * 1.00a rmm 03/13/02 First release
 * 1.00a rpm 08/04/03 Removed second example and invalid macro calls
 * 2.00a jhl 12/15/03 Added support for dual channels
 * 2.00a sv 04/20/05 Minor changes to comply to Doxygen and coding guidelines
 * 3.00a ktn 11/20/09 Minor changes as per coding guidelines.
 * 4.1 lks 11/18/15 Updated to use canonical xparameters and
 *           clean up of the comments and code for CR 900381
 * 4.3 sk 09/29/16 Modified the example to make it work when LED_bits are
 *           configured as an output. CR# 958644
 * ms 01/23/17 Added xil_printf statement in main function to
 *         ensure that "Successfully ran" and "Failed" strings
 *         are available in all examples. This is a fix for
 *         CR-965028.
 * 4.5 sne 06/12/19 Fixed IAR compiler warning.
 *
 * </pre>
 */

The screenshot shows the 'Board Support Package' configuration window. The left sidebar lists projects: '0421vitis' (selected), 'ps7\_cortexa9\_0' (selected), 'zynq\_fslb' (selected), and 'standalone on ps7\_cortexa9\_0'. Under 'ps7\_cortexa9\_0', 'Board Support Package' is selected. The main area displays the 'Operating System' settings for 'standalone' version 7.2. It includes a note about clearing existing modifications and a link to 'Load BSP settings from file'. Below this is a table of drivers:

Name	Driver	Documentation
axi_gpio_0	gpio	<a href="#">Documentation Link</a>

## gpio\_v4\_6

Xilinx Vitis Drivers API Documentation

The screenshot shows the API documentation for 'gpio\_v4\_6'. The top navigation bar includes 'Overview', 'Data Structures', 'APIs' (selected), 'File List', and 'Examples'. The left sidebar has sections for 'gpio\_v4\_6' (expanded), 'Data Structures' (collapsed), 'APIs' (expanded), and 'All' (selected). Under 'All', there are links for 'Functions', 'Variables', and 'Macros'. The right panel lists documented functions, variables, defines, enums, and typedefs:
